29.4 Max Difficulty Settings	76
29.5 Carried Forward from Wave 1	76

Mod Manager V0.7.11 Guide

Overview

Mod Manager V0.7.11 is an external Windows tool for managing Farming Simulator 25 mod profiles. Instead of manually swapping mod folders, it changes the active mod path in `gameSettings.xml`, letting you quickly switch between setups for different playthroughs.

Key concept: The tool does NOT move or delete mods. It only changes which mod folder the game looks at. Each wave in this guide uses a different mod folder, so you can switch between them without reinstalling anything.

Installation

1. Download from fs25.net/mod-manager-v0-7-11/
2. Extract the ZIP file to a permanent location
3. Run **LS25_ModManager_v0.7.11.exe**

Windows SmartScreen warning: On first launch, Windows may block the EXE because it lacks a digital signature. Click **More information** → **Run anyway**.

4. If the FS25 folder is not auto-detected, select it manually
5. The tool will auto-detect your Documents / OneDrive path for mod folders

Configuration

1. **Game path:** Set to your FS25 install folder (if not auto-detected)
2. **Mod folder location:** Defaults to Documents\My Games\FarmingSimulator25
3. **Backup:** Automatic `gameSettings.xml` backup before each profile switch

Setting Up Wave Profiles

The mod manager works by switching which mod folder is active. Create a separate folder for each wave:

Step 1: Create mod folders

In your FS25 mods directory, create one folder per wave:

```
Documents\My Games\FarmingSimulator2025\  
├── mods_FVB_Wave0\      # Wave 0 mods go here  
├── mods_FVB_Wave1\      # Wave 0 + Wave 1 mods go here  
└── mods_FVB_Wave2\      # Wave 0 + Wave 1 + Wave 2 mods go here
```

Step 2: Place mod files

Copy mod ZIP files into the appropriate folder: - **Wave 0**: Place all Wave 0 mods into `mods_FVB_Wave0\` - **Wave 1**: Place all Wave 0 mods + Wave 1 mods into `mods_FVB_Wave1\` - **Wave 2**: Place all Wave 0 + Wave 1 + Wave 2 mods into `mods_FVB_Wave2\`

Step 3: Activate a profile

1. Open Mod Manager
2. Select the mod folder you want to use (e.g., `mods_FVB_Wave0`)
3. Click **Activate**

The tool updates `gameSettings.xml` to point to that folder. The game will now load mods from that folder on launch.

Step 4: Verify

Launch FS25. Check the mods list in-game to confirm all mods are loaded.

Switching Between Waves

1. **Close Farming Simulator 25 completely** (the tool blocks switching while FS25 is running)
2. Open Mod Manager

3. Select a different mod folder
4. Click **Activate**
5. Launch FS25

Your game saves are independent of the mod profile, but remember: loading a save from Wave 0 with Wave 2 mods active may cause issues. Start a new save for each wave.

Features

- Download FTP mods directly through the tool
- Automatically replace existing mods when updating
- History/log of profile switches
- Dark modern design

Troubleshooting

- **Mod not showing in-game:** Verify the mod ZIP file is in the active mod folder. Check the game log at Documents\My Games\FarmingSimulator2025
- **Profile won't activate:** Ensure LS25 is fully closed (check Task Manager).
- **GameSettings.xml not found:** Manually point the tool to your Documents folder.
- **Mod conflicts:** Check `conflicts.md` in this project for known incompatibilities between specific mods.

Reshade for Farming Simulator 25

What is Reshade?

Reshade is a generic post-processing injector that enhances game visuals — ambient occlusion, depth of field, color correction, sharpening, SMAA anti-aliasing, and more. It supports Direct3D 9/10/11/12, OpenGL, and Vulkan.

- **Current version:** 6.7.3 (released February 28, 2026)
- **Source:** reshade.me
- **Open source:** BSD 3-clause license

Installation

1. Download **ReShade_Setup_6.7.3.exe** from reshade.me
2. Run the setup tool
3. Click **Select game** and browse to `FarmingSimulator2025.exe` in your FS25 install folder
4. Select the rendering API — for FS25, choose **DirectX 10/11/12**
5. When prompted for effects, choose **Standard effects** (recommended for FS25)
6. Click through the remaining setup steps
7. Launch Farming Simulator 25

On first game launch, the ReShade overlay appears. Follow the tutorial or skip it. You can open the overlay at any time by pressing **Home** (default — this keybind can be changed in ReShade settings).

Loading a Preset

Presets are `.ini` files that define which effects are active and their settings. To use one:

1. Download the preset `.ini` file
2. Place it in the same folder as `FarmingSimulator2025.exe`
3. In-game, press **Home** to open the overlay
4. Click the preset dropdown at the top and select the preset file
5. ReShade applies all the effects automatically

Performance Tips

- Reduce the render scale in ReShade settings if you experience FPS drops
- Turn off heavy effects during gameplay (Depth of Field, Bloom) — reserve them for screenshots
- Use **Performance Mode** in ReShade settings for everyday gameplay
- The default effects package is lightweight; only add effects you'll use

Preset Sources

- [Nexus Mods — FS25 Visuals & Graphics](#) (filter for “reshade”)
- FS25 modding Discord communities
- Direct links provided in each wave's Visuals & Reshade category file

Wave-Specific Presets

The same Reshade installation works for all three waves — you only install it once. Each wave has its own recommended preset, listed in the wave's `02-visuals-res` file. To switch presets, simply select a different `.ini` file in the ReShade overlay.

Troubleshooting

- **Overlay doesn't appear:** Check the ReShade log in the game folder. Ensure you selected the correct graphics API during installation.

- **FPS drops significantly:** Disable Depth of Field, MXAO, and RTGI effects first — these are the most expensive.
- **Preset not showing in dropdown:** The `.ini` file must be in the same folder as the game executable. Renamed files must keep the `.ini` extension.
- **Multiplayer:** ReShade automatically disables depth access in multiplayer to prevent exploitation. Visual effects that don't need depth data (color correction, sharpening) still work.

Wave 0: The Homestead

The letter arrived on a rainy Tuesday. Solicitor Henderson's office, 2 PM sharp. You almost threw it out — another bill, another notice, another piece of your fractured life demanding attention you didn't have. But the return address caught your eye: a village name you hadn't thought of in fifteen years.

Your great-uncle Arthur had passed. The old family farm — sixty acres of overgrown pasture, a sagging barn, a cottage with a leaky roof — was yours now. No mortgage. No debt. Just the land, the silence, and a lifetime of neglect.

They told you to sell it. "The math doesn't work," they said. "Small farming is dead." But Arthur kept that place alive for fifty years with nothing but stubbornness and a rusted old tractor from an era when machines were built to be repaired. Maybe there's something to that.

You packed a bag. Took the train. Stepped off at a station that hadn't changed since the 1970s. The air smelled different here — wet earth, cut grass, woodsmoke from somewhere distant.

The farm was worse than you remembered. But the cottage had a working stove, the well had clean water, and in the barn, under a tarp, sat Arthur's tractor. Engine seized. Tires flat. But there.

You made tea. Sat on the porch. Watched the rain move across the valley. Tomorrow, you'd find out if you could actually do this.

Getting Started — A Complete Beginner's Guide to FS25

1. First Launch

Graphics Settings

- Resolution: Native monitor resolution
- FSR/DLSS: On if available (boosts FPS)
- Grass Draw Distance: Medium (high impact on performance)
- Shadows: High (big visual impact, moderate performance cost)
- Volumetric Fog: Off (high performance cost, minimal gameplay impact)

Controls Basics

Action	Keyboard	Gamepad (Xbox layout)
Move vehicle	W/A/S/D	Left stick
Steer	A/D or mouse	Left stick L/R; Right stick for camera
Brake / handbrake	Space	LT (left trigger)
Accelerate	W (hold)	RT (right trigger)
Toggle beacon	B	LB + B
Toggle cruise control	X	LB + X
Toggle reverse	V	LB + Y
Lower/raise implement	Q / E	LB + left stick up/down
Lower/raise implement faster	Left Shift + Q/E	LB + D-pad up/down
Switch between vehicles	Tab	LB + RB
Map overview	M	Select (View)
Open store	P	LB + Select

Action	Keyboard	Gamepad (Xbox layout)
Inventory / production	I	LB + Start
Confirm / interact	Enter	A
Menu / pause	Esc	Start (Menu)
Hire AI worker	H	LB + A
Attach/detach implement	G	LB + D-pad left
Unload trailer	U	LB + D-pad right
Enter/exit vehicle	E	Y
Horn	N	Right stick click
Lights	F	LB + right stick click

Tip: FS25 supports plug-and-play controller switching. You can use mouse+keyboard for menus and management, then grab the controller for field work — the game transitions seamlessly without any settings change.

2. Your First 15 Minutes

When you first load into the game, don't buy anything. Don't start a field. Just breathe.

Walk the Farm

- Open the map (M) and study your land — note field sizes, road access, sell points
- Walk (not drive) to each building — learn what's where, check the silo capacity, note which animal pens exist
- Find the nearest sell point and drive there once (memorize the route for later)
- Check the price menu (P) — note which crops are selling high today, then check the calendar for what can still be planted

Your First Decision: What to Grow

- **New players:** Start with wheat or barley. Simplest equipment, reliable profits, sellable year-round. You cannot go wrong here.
- **If you're feeling bold:** Canola requires the same equipment as grains but pays more. It's the same workflow with a better margin.

- **Avoid early:** Potatoes, sugar beets, corn silage. These need expensive specialized gear. They're a trap in Week 1.

Map Your Route

Before you touch a machine, walk the route from your silo to the sell point. Note bridge clearances, sharp turns, and hills — you'll be driving this route loaded, and getting stuck costs you real time and money. Width matters: a loaded trailer behind a tractor takes up more road than you think. Turn off traffic initially if you want to learn without cars honking at you, but turn it back on once you've got the basics — it adds tension that makes the game feel alive.

First Purchase Checklist

1. **Tractor** (medium, ~150–200 HP — enough for basic implements plus room to grow)
2. **Cultivator or disc harrow** (matches your tractor's horsepower)
3. **Seeder** (direct seeder if budget allows — cultivates AND seeds in one pass)
4. **Fertilizer spreader** (cheapest option — solid fertilizer, one stage at a time)
5. **Weeder** (cheapest mechanical weeder — only works on early-stage weeds)
6. **Trailer** (for transport — match capacity to your field size)
7. **Combine harvester + grain header** (this is your biggest purchase — consider leasing your first harvest to test which combine size feels right)

Don't buy everything at once. Buy as you need it. A tractor + cultivator + seeder gets you through the first week. Harvest equipment waits until the crop is ripe.

Take a Loan... or Don't

The Advanced Bank System mod (included in Wave 0) gives you better loan management than vanilla. But here's the key principle: **only borrow for assets that generate income**. A tractor that lets you farm faster pays for itself. A decorative shed does not. Keep your loan-to-asset ratio below 50% — if your equipment is worth \$200,000, don't owe more than \$100,000. The interest will eat you alive otherwise.

3. The Farm Yard

Your farm starts with:

- A **farmhouse** (no function, just aesthetic)
- A **workshop** (repair vehicles — costs money)
- A **silo** (stores grain, grass, and chaff)
- A **manure pit** (stores manure from animals)
- Empty **animal pens** (buy animals later)

4. Basic Field Work

The core farming loop:

Step 1: Plow / Cultivate

- **Plowing:** Required every 3 harvests (or if field has rocks/weeds). Creates new field edges.
- **Cultivating:** Prepares seedbed. Faster than plowing. Required between harvests.
- Which one? After harvest, cultivate (faster). After 3 harvests or when the field says “needs plowing,” plow.

Step 2: Seeding / Planting

- Use a seeder or planter
- Different crops require different seasons:
 - **Spring:** Wheat, barley, oats, canola, potatoes, sugar beets
 - **Summer:** Corn, sunflowers, soybeans
 - **Autumn:** Wheat (for next year), grass (anytime)
- The in-game calendar shows ideal planting windows

Step 3: Fertilizing

- Two stages: fertilize after seeding, then again after crop sprouts
- Each stage gives +50% yield (at standard difficulty)
- Methods: fertilizer spreader (solid), sprayer (liquid), manure spreader, slurry tanker

Step 4: Weeding

- Weeds appear after seeding (visible as small red plants on the field map)
- Use a weeder (mechanical, early stage) or sprayer with herbicide (any stage)
- Weeds reduce yield if ignored

Step 5: Harvesting

- Crop is ready when the field turns the crop's color (e.g., wheat turns golden)
- Check the growth stage on the map (fully grown = harvestable)
- Use the correct header/attachment for each crop type
- **Direct cutting** for grains: combine + grain header
- **Forage harvesting** for grass/chaff: forage harvester + pickup header

Step 6: Selling

- Drive harvested crop to a sell point (marked on map)
- Prices vary daily — check the price menu (P key) for best prices
- Store in your silo and wait for high prices

5. Crop Types

Grains (wheat, barley, oats, canola)

- Easiest to start with
- Use a combine harvester with a grain header
- Can be sold directly or processed into flour, oil, etc.

Root Crops (potatoes, sugar beets)

- Require specialized planters and harvesters
- Higher profit per acre but more expensive equipment
- Best for players with some experience

Grass

- No replanting needed — grows back after cutting

- Use a mower, tedder (to dry into hay), windrower, and baler
- Feed for animals or sell as bales

Corn & Sunflowers

- Tall crops, require front attachment for the combine (corn header, sunflower header)
- Corn can also be chopped for silage (high profit)

6. Animals

Types

- **Chickens:** Cheapest entry. Produce eggs. Low maintenance.
- **Sheep:** Produce wool. Need grass/hay.
- **Cows:** Produce milk. Most profitable but most expensive. Need hay, straw, and TMR (Total Mixed Ration = hay + straw + silage).
- **Pigs:** Produce slurry. Eat almost anything (grain, root crops, leftovers).

Daily Routine

1. Feed animals (fill troughs at the pen)
2. Collect water (if not automatic)
3. Clean pen (remove manure/slurry)
4. Collect produce (eggs, milk, wool)

Profitability Note

Animals are a long-term investment. The upfront cost is high, and daily care is ongoing. But the passive income from milk/eggs/wool adds up significantly.

7. Contracts

Contracts appear at the bottom of the map screen. You can:

- **Do it yourself:** Use your own equipment, get full payment + bonus for completion

- **Rent equipment:** Cost deducted from payment, but equipment is provided
- **Lease out:** Pay AI to do it, get reduced profit

Tips

- Accept contracts that match your existing equipment (no rental cost = max profit)
- Field work contracts (harvesting, fertilizing) are best early-game
- Transport contracts are fast and easy
- Contracts with the same NPC repeat frequently — good relationship = more contracts

8. Economy Basics

Loans

- Maximum loan increases with farm value
- Interest accrues daily
- Best used for essential equipment purchases early on
- Pay down aggressively once you have steady income

Leasing vs. Buying

- **Lease:** Pay hourly. Return anytime. Good for one-off jobs (specialized harvesters).
- **Buy:** Full cost upfront. Better for frequently used equipment (tractor, basic implements).

Repairs

- Vehicles degrade with use
- Repair in the workshop (costs money) or at dealer (more expensive)
- Degraded vehicles lose power and speed

Seasons (if enabled)

- Crops planted out of season won't grow

- Winter: fields are inactive. Focus on animals, contracts, and maintenance.
- Snow must be cleared if you want to drive on your farm.

9. Automation (Without Mods)

You can't install CoursePlay yet — and that's by design. Learning what the AI can and cannot do in vanilla teaches you when automation is actually solving a problem versus when it's just a shortcut.

AI Workers (H key)

The base game AI is your first automation tool:

- **What it does well:** Straight line field work. Cultivating, seeding, fertilizing, harvesting — if the field is rectangular and the implement is matched to the tractor, the AI handles it.
- **What it does poorly:** Irregular fields, headlands, tight vineyard rows, transport between fields. The AI will miss corners and get stuck on trees.
- **Best practice:** Do the headlands yourself (two passes around the perimeter), then hire the AI for the middle. You handle the precision work; the AI handles the mindless straight-line grinding.

Multi-Worker Operations

You can hire multiple AI workers simultaneously on different fields:

- One cultivates Field A while you seed Field B
- One harvests while you run a grain cart to the silo (the most profitable two-person operation in the game)
- One fertilizes a completed field while the other sprays herbicide on another

What You Can't Automate in Wave 0

- Road transport between farm and sell points (AI won't pathfind roads — this is why CoursePlay exists in Wave 1)
- Equipment relocation — you drive between fields, the AI works the field
- Vineyard work — small row widths and trellises confuse the base AI (vineyard CoursePlay support arrives in Wave 1)

- Multi-step chains — the AI won't unload a combine into a trailer, then drive the trailer to the silo, then return

The Automation Mindset

Every hour you spend driving a straight line is an hour you're not making strategic decisions. As your farm grows, **you should graduate from operator to manager**. Wave 0 forces you to do both. By Wave 1 and 2, the automation mods let you spend your time on the decisions that only you can make: what to plant, when to sell, where to expand, which production chains to invest in. Don't automate the wrong thing — automate the boring thing. Keep the interesting work for yourself.

10. Your First Season — A Roadmap

Here's a structured pathway through your first year. Follow this loosely — adapt to prices, weather, and what feels right.

Spring (March–May)

1. **Week 1:** Buy tractor + cultivator + seeder. Cultivate your smallest field. Seed wheat or barley. Apply first fertilizer stage. Accept a fertilizing contract — same equipment you already own, pure profit.
2. **Week 2:** Crop sprouts. Apply second fertilizer stage. Buy a weeder and remove any weeds. Accept more contracts — focus on ones using equipment you own. Begin saving for your combine harvester.
3. **End of Spring:** All spring crops should be in the ground. If you have multiple fields, stagger planting by 2-3 days so harvest doesn't all arrive at once and overwhelm your equipment.

Summer (June–August)

1. Your spring wheat/barley is growing. This is your calmest season.
2. **Focus on contracts** — harvesting contracts for AI neighbors pay well and teach you how combines handle before your own crop is ready.
3. **Harvest your spring crop** (likely July). This is your first big payday. Drive it to the sell point if prices are high, or store it in the silo and wait for a price spike. Check prices every morning — they can shift dramatically day to day.

4. **After harvest:** Immediately cultivate and either re-seed (wheat for a fall harvest) or plant a cover crop (grass for winter animals).

Autumn (September–November)

1. If you planted a second wheat crop in summer, harvest it now.
2. **Plowing check:** If the field says “needs plowing,” do it now. Plowing in autumn means you start spring with a ready field.
3. **Equipment maintenance:** Harvest season is hard on machines. Repair everything before winter — degraded equipment in spring costs you planting days.

Winter (December–February)

1. **Fields go dormant.** This is your management season.
2. **Audit your finances:** How much did you make? What was your biggest expense? What equipment sat unused? Cut waste.
3. **Animals:** If you bought chickens or sheep, this is when they earn their keep (steady income when crops aren’t growing).
4. **Plan Wave 1:** You’ve finished Wave 0. You know how fields work, how the economy breathes, what the AI can and can’t do. You’re ready for CoursePlay, vineyards, and a new map. Close the books, sell unused equipment, and prepare to leave the homestead behind.

11. Production Chains

Basic production chains available in vanilla:

- **Grain → Flour → Bread** (requires bakery building)
- **Canola → Oil** (requires oil mill)
- **Sugar Beets → Sugar** (requires sugar mill)
- **Milk → Cheese / Butter** (requires dairy)
- **Wood → Planks → Furniture** (requires sawmill + carpentry)

Production buildings are bought from the store and placed on your land. They accept raw materials and output processed goods for higher sale prices.

12. Mod Manager Setup

See the [Mod Manager guide](#) for detailed instructions.

Quick steps:

1. Install Mod Manager V0.7.11
2. Create a mod folder called mods_FVB_Wave0
3. Add the mods listed in the following category files
4. Activate the folder in Mod Manager

13. Reshade Setup

See the [Reshade guide](#) for detailed installation.

Wave 0-specific preset recommendations are in the [Visuals & Reshade mod list](#).

Wave 0 — Map: Oak Bridge Farm

Name	Author	Source	Version	Notes
Oak Bridge Farm	Oxygendavid	ModHub (#312208)	1.1.0.0	⚠ No update since Feb 2025; v1.20.0.0 compatibility unverified. Spiritual successor to Calmsden Farm.

Why Oak Bridge Farm?

Oxygendavid's successor to the legendary Calmsden Farm. A compact UK map designed for small-scale, realistic farming:

- **36 fields** with missions — manageable scale for a beginner
- **5 sell points + BGA + sawmill** — all the economic options without overwhelming choice
- **Custom lighting and seasonal visuals** — atmospheric without needing additional visual mods
- **Tight lanes and hedgerows** — forces careful driving and realistic small-equipment use
- **Built-in collectables and custom sounds** — world feels lived-in from day one

The internal filename is FS25_calmsden.zip confirming its Calmsden heritage.

Wave 0 — Visuals & Reshade

Reshade

No FS25-specific Reshade presets were found on Nexus Mods, FS25.net, or ModHub as of July 2026. Instead:

1. Install Reshade using the [Reshade guide](#)
2. Use the default effects package
3. Enable these effects for a natural look:
 - **Levels** — adjust brightness and contrast
 - **Vibrance** — subtle color enhancement
 - **SMAA** — anti-aliasing (better performance than in-game MSAA)
 - **LumaSharpen** — subtle sharpening without over-processing
 - Optional: **AmbientLight** for warmer sunrises/sunsets

Oak Bridge Farm already includes custom lighting, so keep Reshade effects conservative.

Visual Mods

Name	Author	Source	Version	Notes
High Beam Distance Extender	zuce1992	Nexus Mods #185	—	⚠ Doubles high beam headlight range on all vehicles. July 2026.

Name	Author	Source	Version	Notes
Real Wheels Mod	LightningProduction	Nexus Mods #189	—	⚠ Improves tire physics — friction, sinking, rolling resistance, crawler behavior. MP supported. July 2026.

Not Available

The following FS22 visual mods have not been ported to FS25:

- **Relight** — FS22 lighting overhaul, no FS25 version exists
- **Skybox/weather mods** — no dedicated FS25 visual mods found on any platform
- **Reshade presets** — no community presets published for FS25 yet (Nexus Mods FS25 section has 132 mods, none are reshade presets)

Use manual Reshade tuning and rely on Oak Bridge Farm's built-in lighting instead.

Wave 0 — UI & Quality of Life

Name	Author	Source	Version	Notes
Advanced Bank System	t3rrox96	ModHub (#368590)	—	❗ Adds banking features — loans, deposits, interest management.
Sync Cruise Control	gsShooter	ModHub (#367997)	—	❗ Synchronizes cruise control across vehicles. QoL.
Radial Vehicle Switcher	DrivePro	Nexus Mods #155	—	❗ Radial menu for quickly switching between owned vehicles. March 2026.
Traffic Density Control	Razak	ModHub (#367754)	—	❗ Control traffic density on roads. Visual/QoL — makes the world feel more alive.

Not Available

The following popular FS22 QoL mods have **not been ported** to FS25 as of July 2026:

Mod	Status
Follow Me	No FS25 version exists. Decker_MMIV has not ported from FS22.
Enhanced Vehicle HUD (VCA)	No FS25 version. This FS22 staple (RPM, fuel, speed display) is a notable gap.
CoursePlay	Exists (ModHub #331515, GitHub, v8.1.0.3) but classified as gameplay-altering . Deferred to Wave 1.

Wave 0 Recommended Settings

- **Economic Difficulty:** Normal
- **Plant Growth:** Normal (not fast — learn the rhythm)
- **Fuel Usage:** On
- **Traffic:** On
- **Auto-Repair:** Off (experience the cost of neglect)
- **Seasons:** On (learn crop timing from the start)

Wave 0 — Vehicles

No additional vehicle mods in Wave 0. The vanilla FS25 vehicle roster is sufficient for beginner gameplay.

Wave 0 — Implements & Attachments

No additional implement mods in Wave 0. Vanilla FS25 implements cover all basic field work.

Wave 0 — Placeables & Buildings

No additional placeable mods in Wave 0. Vanilla placeables cover all basic needs.

Wave 0 — Gameplay & Difficulty

No gameplay-altering mods in Wave 0. This wave uses vanilla difficulty settings.

Recommended Settings

Setting	Recommendation
Economic Difficulty	Normal
Plant Growth	Normal (not fast — learn the rhythm)
Fuel Usage	On
Traffic	On
Auto-Repair	Off (experience the cost of neglect)
Seasons	On (learn crop timing from the start)

Wave 1: Fields, Vines & Barrels

You sold the homestead. Not because you wanted to, but because the offer was too good to refuse — a young couple with dreams and a bank loan, and you knew Arthur's farm would be in good hands. The money sat in your account for six months while you travelled, restless, looking for something that felt like yours.

You found it in a real estate listing for a French vineyard. "Domaine du Mechet — 12 hectares of vines, traditional farmhouse, stone cellar. Needs restoration."

The photos showed a wreck. Overgrown rows. A collapsed barn. A house with shutters hanging at desperate angles. But the land — rolling hills, a river bend, sunset colours you'd never seen anywhere else — that land was waiting.

You flew out the next week. Walked the property with an old viticulturist who'd worked there forty years ago. He pointed at the vines, at the soil, at the sky. "This place makes wine," he said. "It just needs someone to let it."

You bought it.

Now you're standing in a dusty cellar, surrounded by empty barrels older than you are, holding a bottle of wine from 1987 — the Domaine's last vintage before it closed. You don't know if you can do this. But you're going to try.

Wave 1 Strategy Guide

Efficiency — Working Smarter, Not Harder

Wave 1 is where you stop being a one-person operation and start thinking like a manager. Efficiency isn't about working faster. It's about spending your time on things only you can do.

The CoursePlay Advantage

CoursePlay (now available in Wave 1) transforms how you use your time:

- **Vineyard operations:** CoursePlay handles mulching, cultivating, and spraying rows — the repetitive passes that would otherwise consume entire sessions. Configure the route once, save it, and replay it every season.
- **Multi-vehicle coordination:** Set a harvester to work a field while a transport tractor runs a grain cart route to the silo. Two machines, one operation, zero babysitting.
- **Saved courses:** Don't rebuild routes every season. Save vineyard row courses, transport paths, and field-work patterns. The initial setup time pays back tenfold over a full growing cycle.
- **WayPoint GPS:** Route your transport vehicles between production buildings and sell points. Click a point on the map and the vehicle drives there. No more watching the road for five minutes per trip.

Batch Your Operations

- Fertilize and weed all fields in one session, not one field at a time. Swapping implements costs time — minimize tool changes.
- Harvest all ready fields before starting any post-harvest work. The combine stays attached until every field is done.

- Do all maintenance in winter. Don't repair mid-season unless something breaks — scheduled maintenance is cheaper than reactive repairs.

The Transport Bottleneck

The single biggest efficiency killer in FS25 is transport. Every minute your combine sits idle waiting for a trailer is lost money:

- **Dedicated transport tractor:** Assign one tractor exclusively to grain cart duty during harvest. It never does field work. It just shuttles.
- **Overflow trailers:** Park an extra trailer at the field edge. When the primary grain cart is en route to the silo, the combine unloads into the overflow trailer. Zero combine downtime.
- **Silo proximity:** Place new silos near your largest fields, not near the farmhouse. Transport distance is the variable you control most.

What NOT to Automate

- **Vineyard harvesting:** Grape harvesters need precision row entry. CoursePlay can handle it, but one wrong turn into a trellis post costs you real repair money. Supervise harvests.
- **Selling decisions:** Never automate when to sell. Prices move. You need human judgment on whether to hold or dump.
- **First pass on a new course:** Always observe a new CoursePlay route for one full loop before walking away. AI pathing surprises are expensive.

How to Grow Your Business

The Expansion Flywheel

Your business grows in cycles, not linearly:

1. **Sell processed goods** → generate cash
2. **Invest cash** → buy more production capacity or more fields
3. **More capacity** → more processed goods
4. **More goods** → more cash
5. **Repeat**

The trap: buying equipment you don't need yet. The discipline: every purchase should either increase throughput or reduce a bottleneck.

When to Expand Production

Add a new production line when:

- Your existing line is running at full capacity and you have surplus raw materials piling up
- You can afford the building *and* the raw material buffer to feed it for one full season
- The new product's profit margin exceeds the interest rate on your loan (if you're borrowing to build)

Don't expand production when:

- You're barely keeping your current buildings fed with raw materials
- You'd need to take a loan exceeding 50% of your current asset value
- The new product requires inputs you don't already grow (buying raw materials kills margin)

Wine First, Beer Second

Wine has the highest unit value of any product in Wave 1. A batch of aged wine sells for 3–5x the value of the raw grapes. The tradeoff is time — wine must age, which ties up capital in barrels. Start wine production immediately (fill barrels), then plant barley/hops while the wine ages. By the time your barley is ready for harvest, your first wine batch is ready to bottle. The cash from wine funds the brewery expansion.

Diversification vs. Specialization

- **Specialize early:** In your first year on Le Mechet, focus on grapes and wine. Learn the vineyard workflow. Get good at one thing before you add a second.
- **Diversify for stability:** Once wine production is stable and profitable, add beer. Two revenue streams smooth out price fluctuations. If wine prices dip, beer might be peaking. If both dip, you have contracts as a safety net.
- **Don't add more than two new production lines per wave:** Each production line adds management overhead — more inputs to track, more outputs to transport, more buildings to maintain. Three lines is a business. Six is chaos.

Reinvestment Ratio

A healthy farm reinvests **60–70% of profits** back into the operation. The remaining 30–40% is your buffer — cash for emergency repairs, price opportunity buys, and the loan principal. If you're reinvesting 100%, one bad harvest wipes you out. If you're reinvesting 20%, you're not growing.

Expansion — When, Where, and Whether

When to Buy New Fields

A new field is the highest-leverage purchase you can make — it's the only asset that directly increases your raw material input. Buy when:

- Your existing fields can't supply your production buildings (buildings sit idle waiting for inputs)
- You have the equipment to work the new field *without* buying additional machinery
- The field is adjacent to your existing land (non-adjacent fields add transport cost that compounds every season)
- You can afford the field in cash or with a loan that will be repaid within two harvest cycles

When to Buy New Equipment

New equipment only makes sense when it removes a constraint:

- **Buy a second tractor** when you're losing planting/harvesting days because one tractor can't be in two places
- **Buy a larger implement** when field work time exceeds the weather window (a 4-hectare field that takes 3 real hours to cultivate needs a wider implement or a second worker)
- **Buy a second trailer** when your combine waits more than 30 seconds for the grain cart to return
- **Lease specialized equipment** used fewer than 10 hours per season (grape harvester attachments, specialized sprayers)

The Sunk Cost Trap

You already own a small tractor from Wave 0. It was the right purchase then. Now it's underpowered for your new fields. **Sell it.** Don't keep equipment

because you paid for it — keep it because you use it. Every piece of machinery sitting idle is capital that could be in a field, a production building, or a loan repayment. The farm is not a museum.

Map Knowledge Before Expansion

Before buying any new field, do reconnaissance:

- Walk the perimeter. Look for obstacles (trees, buildings, rocks) that will complicate CoursePlay routes.
- Time the drive to your nearest silo and production buildings. If round-trip transport exceeds 3 minutes, that field is a drag on your entire operation.
- Check the field's shape. CoursePlay handles rectangles best. Irregularly shaped fields need more babysitting and generate more wasted overlap passes.
- Know the soil. In Wave 1, Precision Farming adds soil types. A field with poor soil needs more fertilizer and lime — it may not be the bargain it appears to be.

Signs You're Expanding Too Fast

- You're spending more time managing AI workers than doing actual farm work
- Your loan interest exceeds 10% of your monthly income
- You can't name all your fields from memory
- Production buildings sit idle because you can't grow inputs fast enough to feed everything
- You dread loading the save because there's too much to manage

Expansion is about throughput, not acreage. A small farm running at 100% capacity out-earns a large farm running at 60%. Scale when you have to, not when you can.

Wave 1 — Map: Le Mechet

Name	Author	Source	Version	Notes
The Mechet (Le Mechet)	Ma7	fs25.net	1.0.0.2	⚠ Not on ModHub. June 2026 release. Companion pack available.

Why Le Mechet?

A purpose-built French vineyard map designed around wine production:

- **12 hectares of established vines** — start producing from day one
- **Traditional farmhouse and stone cellar** — atmospheric setting for the winery story
- **Companion production pack** by the same author (Ma7) adds industry buildings
- **June 2026 release** — recent, likely v1.20.0.0 compatible

Companion Mods

WayPoint GPS	—	fs25.net	Beta 5	❗ GPS waypoint routing. CTRL-click on map. June 2026.

Carried Forward from Wave 0

- Advanced Bank System
- Sync Cruise Control
- Radial Vehicle Switcher
- Traffic Density Control

Wave 1 — Vehicles

Mods added in this wave beyond Wave 0.

Tractors (Mid-Tier 150–250 HP)

Name	Author	Source	Version	Notes
John Deere 6R Series Pack	Kalderone	ModHub #336559	—	❗ 4.7 * (916). User Favourite. 175-250 HP. NA/EU versions.

Vineyard & Compact Tractors

Name	Author	Source	Version	Notes
SDF Vineyard Pack	—	fs25.net	1.0.0.1	❗ SAME/Deutz-Fahr/Lamborghini vineyard tractors.
Carraro Tractors Compact VLB 75	—	fs25.net	1.0	❗ Narrow vineyard tractor. Feb 2026.

Grape Harvester & Vineyard Equipment

Name	Author	Source	Version	Notes
Tools for Grapes and Olives	—	fs25.net	1.0	[!] All-in-one pack: mulcher, cultivator, sprayer, spreader, grape trailer, vine trimmer, grape + olive harvester. March 2026.

Telehandlers & Loaders

Name	Author	Source	Version	Notes
JCB Construction Loadall	RossN Mods	ModHub #320939	—	[!] Telehandler for pallet/bottle handling.

Wave 1 — Implements & Attachments

Mods added in this wave beyond Wave 0.

Cultivators & Seeders

Name	Author	Source	Version	Notes
Stara Asa Laser Pack	John GM	ModHub #367566	1.0.0.0	 Cultivator + seeder combo, 4.94m width, 220 HP. Crossplay. July 2026.

Sprayers

Name	Author	Source	Version	Notes
Berthoud Vantage Sprayers	GuiGuiGaming	ModHub #365939	1.0.0.0	 4.9 * (10). 33m working width, \$62,000. ISOBUS. Crossplay.

Mowers

Name	Author	Source	Version	Notes
Kuhn Mower Pack	Farming Duds	ModHub #350840	—	 4.8 * (118). Grass/hay mowing equipment.

Vineyard Implements

Covered by **Tools for Grapes and Olives** (see Vehicles — includes vineyard mulcher, cultivator, sprayer, spreader, vine trimmer).

Wave 1 — Placeables & Buildings

Mods added in this wave beyond Wave 0.

Wine & Beer Production

Name	Author	Source	Version	Notes
WINERY	Giants / TheSnake	fs25.net	1.0.0.1	[!] Wine, grape juice, and mead production. 95 MB.
Brewery and Hop Plantation	—	fs25.net	1.0.4	[!] €140,000. Input: 190k L barley + hops + water → beer. Includes hop plantation. July 2026.

Map-Specific

Fields, Vines & Barrels

Name	Author	Source	Version	Notes
The Mechet Production And Industry Pack	Ma7	fs25.net	1.0.0.1	 Companion production buildings for Le Mechet map. June 2026.

Storage

Name	Author	Source	Version	Notes
MICHAL Grain Silos	Agro Kamilos, GoldFox	fs25.net	1.0	 \$125,000, 500,000 L capacity. July 2026.

Greenhouses

Name	Author	Source	Version	Notes
Fruit Greenhouse	—	fs25.net	1.4	 Passive olive, grape, and cotton production. July 2026.

Wave 1 — Production & Economy

Mods added in this wave beyond Wave 0.

Wine & Beer Production Chains

Wave 1’s core production loop:

Grapes (vineyard/Fruit Greenhouse) → WINERY → Wine / Grape Juice
Barley (field) + Hops (plantation) + Water → Brewery → Beer

Economy Mods

Name	Author	Source	Version	Notes
Volatile Economy	—	fs25.net	Beta 2	 Dynamic supply/demand. Seasonal demand. Per-sell-point markets. March 2026.

Name	Author	Source	Version	Notes
Tax Mod	—	fs25.net	1.1.5	⚠ Realistic tax system. Daily deductions, monthly returns. Configurable rates (1-3%). July 2026.

Wave 1 — Gameplay & Difficulty

Mods added in this wave beyond Wave 0.

Difficulty Settings (carried forward from Wave 0)

Setting	Value
Economic Difficulty	Normal
Plant Growth	Normal
Fuel Usage	On
Traffic	On
Auto-Repair	Off
Seasons	On

Name	Author	Source	Version	Notes
Precision Farming 3.0	GIANTS Software	ModHub #318936	1.5.1	 4.5 * (9,392). Official free DLC. Soil sampling, tramlines, PWM sprayers, section control, N-sensors. Crossplay.

CoursePlay for Vineyard Operations

CoursePlay (listed in UI & QoL) is classified as both UI and gameplay. For Wave 1:

- Automates vineyard maintenance — mulching, cultivating, spraying rows
- Supports Gregoire GL vine harvester (confirmed in CoursePlay changelog)
- Multi-vehicle coordination for harvest+transport operations

WayPoint GPS

Listed in UI & QoL — provides GPS routing overlay for efficient field + road navigation.

Missing from Wave 1

Mod	Status
AutoDrive base mod	Not on ModHub. 280+ per-map courses exist on fs25.net, base mod likely on GitHub.
Follow Me	Still not ported to FS25.
Enhanced Vehicle HUD (VCA)	Still not ported to FS25.

Wave 2: Empire

The Domaine sold for a sum that made your accountant whistle. A decade of work — restoring the vines, perfecting the blend, building a name — had turned a wrecked vineyard into a trophy property. A hospitality group bought it for their luxury portfolio. You walked away with more money than you'd earned in your entire life.

But you weren't done. Farming wasn't a chapter in your life anymore. It was in your blood.

You looked at a map of America — the vast agricultural heartland where scale is measured in thousands of acres, not hectares. You found a place where the horizon stretches unbroken, where the nearest neighbour is a speck on the horizon, where the soil is measured in square miles instead of acres. Potato country. Wheat country. The kind of land that feeds nations.

The farm you bought there was the opposite of everything you'd known: flat fields that stretched to the curvature of the earth, irrigation pivots like enormous metal insects, equipment that cost more than your first house. This wasn't farming as craft. This was farming as industry.

You stood on the roof of the machine shed and looked out across your new empire. Somewhere behind you, the sun was setting on the French hills. Ahead of you, the horizon was flat and endless and full of possibility.

Time to find out how far you could go.

Wave 2 Strategy Guide

Efficiency at Industrial Scale

In Wave 2, you're not managing a farm — you're running an agricultural corporation. Efficiency at this scale is about systems, not shortcuts.

The Fleet, Not the Machine

Stop thinking about individual vehicles. Think in fleets:

- **Tillage fleet:** All cultivators, plows, and disc harrows serviced and fueled together. They deploy to fields as a unit. If one breaks, the fleet absorbs the downtime.
- **Harvest fleet:** Combines, grain carts, and transport trucks form a single harvest system. A combine without a grain cart is useless. Plan them as a package.
- **Transport fleet:** Dedicated road tractors and trucks that never touch a field. They move goods between silos, production buildings, and sell points. Keep them on pavement.

Synchronize maintenance cycles across fleets. If your entire tillage fleet goes in for service on the same winter day, you're not losing planting time in spring. Staggered maintenance means staggered downtime.

Coordinated Harvest Operations

The harvest is the highest-stakes operation on the farm. A mistimed harvest loses crops to withering. Here's the industrial approach:

1. **Pre-harvest checklist:** Every combine inspected, every grain cart fueled, every trailer hitched, every CoursePlay route verified. Do this the night before. Harvest morning is not debugging time.

2. **Stagger field starts:** Don't start all fields on the same day. Harvest largest field first (longest to complete, most exposure to weather change). Harvest adjacent fields together (minimize equipment relocation). Leave 1–2 days between field starts so transport isn't overwhelmed.
3. **Dedicated roles:** One player (or CoursePlay instance) per role. Combine operator, grain cart driver, transport driver, silo manager. No one switches roles mid-harvest. Role-switching is where mistakes happen.
4. **Buffer capacity:** Always have one extra trailer than you think you need. The cost of a parked trailer is negligible. The cost of a combine idling with a full hopper is lost profit per minute.

The 80/20 Rule of Transport

80% of your non-field time is spent driving between points. Eliminate it:

- **On-farm silos at every major field cluster:** Drive distance from field to storage should be under 60 seconds. Build silos where your fields are, not where your farmhouse is.
- **Dedicated sell-point routes:** Pre-configure WayPoint GPS routes from each production building to the highest-paying sell point for that product. One click, the truck drives itself.
- **Production proximity:** Place processing buildings near the fields that supply them. A grain mill next to a wheat field eliminates the longest leg of transport entirely.
- **Night transport:** Use CoursePlay to run transport convoys overnight. Queue up sell orders, set the routes, and let the fleet work while you sleep (or while you manage the next operation).

Advanced Helper — Your New Workforce

Wave 2's Advanced Helper mod replaces base-game AI workers with a proper employee system:

- Workers gain skills with experience — a 50-hour veteran outperforms a fresh hire
- Assign workers to permanent roles rather than ad-hoc tasks. A transport specialist never does field work. A tillage specialist is your cultivator.
- Hire slow, fire fast. A worker with low skill drags down your entire operation. Pay the premium for experienced hires.
- Track worker hours. If someone's been at 100% workload for two seasons, you need another hire in that role.

How to Grow Your Business in Wave 2

From Wine to Wheat — The Portfolio Approach

Wave 2 is on a large American map where scale replaces craft. Your business model shifts:

- **Wave 1:** High-value specialty products (wine, beer). High margin, low volume. Craftsmanship.
- **Wave 2:** Commodity crops at scale (wheat, corn, soybeans, potatoes). Low margin per unit, enormous volume. The money is in throughput, not unit price. A 1% margin improvement on 500,000 liters is real money.

Capital Allocation Framework

When you have cash to deploy, rank opportunities by **return on investment per season**:

1. **Production buildings** (highest ROI): Turn raw crops into processed goods. A grain mill can pay for itself in 2–3 harvests. Always your best first investment.
2. **Fields** (medium-high ROI): More land = more raw material. But fields only pay back if your production buildings have spare capacity. Buying a field when your mill is already maxed out just means selling raw grain at commodity prices instead of processed prices. That's leaving money on the table.
3. **Equipment upgrades** (medium ROI): A wider combine covers more acres per hour, but only matters if you have the acres to cover. Upgrade equipment when field work time is your bottleneck. Don't upgrade if transport or processing capacity is the real constraint.
4. **Storage** (low but essential ROI): Silos and warehouses don't directly generate revenue, but insufficient storage means selling at low prices because you can't hold for the peak. Storage pays for itself indirectly.

The Loan as a Tool, Not a Crutch

At industrial scale, debt is leverage:

- **Good debt:** A loan to build a production building that generates more monthly income than the interest payment. The building pays for itself while you sleep.

- **Bad debt:** A loan to buy equipment you could have leased. If the equipment earns less per season than the interest on the loan, you're losing money every day.
- **Emergency debt:** A loan to cover operating costs because you spent your cash reserves. This is the beginning of a death spiral. Maintain a minimum cash buffer equal to one full season of operating expenses (seed, fertilizer, maintenance, worker wages).

Market Timing at Scale

When you're producing hundreds of thousands of liters per season, price timing is no longer optional — it's existential:

- **Track price cycles:** Most commodities have seasonal price patterns. Grain peaks in winter (supply is low, demand is steady). Know the cycle for every crop you produce.
- **Never sell at harvest:** Prices are lowest when supply is highest (everyone is selling). Store everything. Wait for the winter peak. The silo pays for itself in one cycle.
- **Diversify sell points:** Don't dump everything at one buyer. Prices drop when you flood a sell point. Spread sales across multiple buyers and multiple days.
- **The Production Storage Control mod (PSC, in Wave 2):** Manually trigger pallet spawning. Wait for peak prices, then spawn and sell everything at once. This is the single most profitable tool in Wave 2.

Expansion — Thinking in Square Miles

Land Acquisition Strategy

In Wave 2, you're not buying fields — you're acquiring production capacity:

- **Consolidate, don't scatter:** Buy adjacent fields. Non-adjacent fields create transport overhead that compounds with every operation, every season, forever. One contiguous block of 200 acres is worth more than four scattered 50-acre fields.
- **Field shape matters at scale:** CoursePlay handles rectangles best. Odd-shaped fields create wasted overlap, missed corners, and babysitting overhead. At 200+ acres, a field with 10% wasted overlap costs you 20 acres of input, output, and time — per season, forever. Buy rectangular fields or use the map editor to square off irregular ones.

- **Soil quality as purchase criteria:** With Precision Farming (Wave 1 carried forward) and Realistic Soil & Fertilizer (Wave 2), soil quality varies across the map. Two fields of equal size can produce 30% different yields. Scout soil maps before writing a check.
- **Water access:** Fields near rivers or lakes support cheaper irrigation. Fields far from water need expensive water transport infrastructure.

Equipment Fleet Sizing

The right fleet size is a math problem:

- **Tractors:** One for every 100 acres of row crops. One dedicated transport tractor per production cluster. One backup tractor for when something breaks.
- **Combines:** One combine can harvest roughly 20–25 acres per game day. If you have 200 acres of grain, you need 2 combines ($2 \times 20 = 40$ acres/day = 5-day harvest window, which is tight but manageable). Three combines would be safer.
- **Grain carts:** One per combine. No exceptions. A combine without a dedicated grain cart is a parked combine.
- **Trailers:** Two per grain cart (one at the field, one at the silo). The shuttle system keeps combines moving.

Production Chain Scaling

When a production line maxes out, you have three choices:

1. **Add a second building** of the same type (horizontal scaling): Simple, expensive in space, doubles your maintenance. Good for grain mills near a second field cluster.
2. **Upgrade to a larger building** (vertical scaling, mod-dependent): Fewer structures to manage, usually more cost-efficient per unit of output. Check if larger-capacity production buildings exist for your chain.
3. **Add a downstream building** (deepening the chain): Instead of a second grain mill, add a bakery. Flour → bread has a better margin than flour alone. Deepening the chain usually beats widening it.

When to Hire vs. Automate

- **Hire Advanced Helpers for:** Field work that requires judgment (headlands, irregular fields, crop-specific adjustments). Workers with high skill outperform CoursePlay on complex fields.

- **Use CoursePlay for:** Repetitive straight-line work, vineyard rows, and transport routes. Saved courses mean zero setup time next season.
- **The hybrid approach:** One skilled Advanced Helper works the headlands while CoursePlay handles the straight-line middle passes. Best of both worlds. No babysitting, no wasted corners.

Signs You've Outgrown Your Map

- You're buying fields just because they're available, not because you need the capacity
- Your production buildings are all maxed out, you have surplus raw materials, and there's no room to place more buildings
- Transport times between your farthest fields exceed 5 real minutes
- You own more than 50% of the arable land on the map
- You can't remember the last time you actually drove a tractor yourself

At this point, you've won the map. The challenge isn't the game anymore — it's whether you can build an operation that runs itself. That's the real endgame. A farm where you make decisions and the machines execute them. Where the money compounds while you watch the sunset from the porch of a farmhouse you earned.

That's what the three waves built. A homestead nobody wanted. A vineyard everybody wanted. An empire only you could build.

Wave 2 — Map: New American

Name	Author	Source	Version	Notes
New American	—	ModHub #315152	1.0.0.2	Remade for FS25. May 2026 update. Crossplay.

Why New American?

A large-scale US map purpose-built for industrial farming:

- **89 fields** (65 agricultural + rice) + 6 forest areas
- **11 production points** — extensive built-in production infrastructure
- **4 selling points + BGA** — full economic loop
- **Precision Farming compatible** — designed for smart farming
- **Custom terrains with GPS-friendly slopes** — optimized for large equipment
- **Second farm area** (field 79) — expand to dual-farm operations

Alternative (PC Only)

Name	Author	Source	Notes
Judith Plains, Montana 4X	DJ Modding	itch.io	[!] Massive 4X map. Custom resources (anhydrous ammonia, propane). 7 empty buildable farm areas. PC only.

Maps Not Found

The originally-proposed maps **American Falls**, **Elk Mountain**, **Flatlands**, and **Saskatchewan** do not exist as named FS25 maps. New American is the best ModHub alternative at similar scale.

Wave 2 — UI & Quality of Life

Mods added in this wave beyond Waves 0 and 1.

Production Management

Name	Author	Source	Version	Notes
Productions Manager	NXModding	ModHub	—	 Production overview — fill levels, capacities, monthly incomes, auto-enable/disable. Export data.
Production Storage Control (PSC)	—	ModHub #315838	—	 Manual pallet spawning, output mode control, Store mode. All platforms.
Production Info Hud	Achimobil	ModHub	—	 HUD overlay showing production status at a glance.

Vehicle & Fleet Management

Name	Author	Source	Version	Notes
Enhanced Vehicle	—	fs25.net	1.1.7.1	[!] GPS, parking brake, differential controls, vehicle management.
Realistic Soil & Fertilizer	—	fs25.net	2.4.6	[!] Soil monitor, map overlay, field panel. Precision Farming compatible. July 2026. 4.4 * (70).

Wave 2 — Vehicles

Mods added in this wave beyond Waves 0 and 1.

Articulated & 4WD Tractors (400+ HP)

Name	Author	Source	Version	Notes
Versatile 4WD Series	Custom Modding	ModHub #364537	1.0.0.0	4.9 * (34). 530-620 HP, \$223,500. 2022-2026 model years. Crossplay. Released July 20, 2026 — highest confidence for v1.20.0.0.
Case IH Steiger Series 2025	KarlFarms	ModHub	—	 Heavy articulated 4WD. Community recom- mended.

Forage Harvesters

Name	Author	Source	Version	Notes
CLAAS JAGUAR 990-930	Despo93	ModHub (Featured)	—	 Forage harvester series. Crossplay.

Self-Propelled Sprayers

Name	Author	Source	Version	Notes
Case IH Patriot 4450	JTerk Modding	ModHub	—	 4.8 * (165). Self-propelled sprayer with wide working width. Heavy-duty.

Wave 2 — Implements & Attachments

Mods added in this wave beyond Waves 0 and 1.

Large Seeders & Planters

Name	Author	Source	Version	Notes
Case IH Concord Air Drill System	—	ModHub	—	 Air drill for large-scale seeding operations.
Bourgault 3420-100	—	ModHub	—	 Self-propelled 30m seeder. Massive working width for industrial fields.

Large Sprayers & Spreaders

Name	Author	Source	Version	Notes
Case IH Patriot 4450	JTerk Modding	ModHub	—	 See Vehicles. 4.8 * (165).
Horsch Leeb PT & 12TD	—	ModHub	—	 Wide-reach sprayers. Community recommended.

Large Balers

Name	Author	Source	Version	Notes
New Holland Big Baler 960A	Peppe978	ModHub	—	 4.8 * (90). Large square baler for industrial baling.

Slurry Equipment

Name	Author	Source	Version	Notes
Slurry Spreaders	Smety	KingMods	—	 Industrial slurry application.
Slurry Tender 21.000	LooneyFarmGuy	ModHub	—	 Large capacity slurry tender. Crossplay. March 2025.

Wave 2 — Placeables & Buildings

Mods added in this wave beyond Waves 0 and 1.

Biogas Plants

Name	Author	Source	Version	Notes
PlanET Modular BGA	PlanET	ModHub	—	 Modular biogas plant. Assemble custom configuration.

Large Sheds & Workshops

Name	Author	Source	Version	Notes
Extra Large Workshop	—	ModHub	—	 38m x 24m equipment shed. Vehicle repaint and sell capability. Crossplay.

Rail & Transport

Name	Author	Source	Version	Notes
North American Trains	—	ModHub #316371	—	[!] Locomotive and grain hopper prefab. 8 railroad textures (BNSF, CN, CP, CSX, NS, UP).

Large Storage

New American map includes built-in large silos. Additional storage from Wave 1 (MICHAL Grain Silos, Fruit Greenhouse) carries forward.

Wave 2 — Production & Economy

Mods added in this wave beyond Waves 0 and 1.

Precision Farming

Name	Author	Source	Version	Notes
Precision Farming 3.0	GIANTS Software	ModHub #318936	1.5.1	Official free DLC. Soil sampling, variable-rate fertilization, PWM sprayers, N-sensors, economic analysis. Carried forward from Wave 1 — essential for Wave 2 industrial operations.

Extended Production Chains

Name	Author	Source	Version	Notes
NX Productions	NXModding	fs25.net	1.0	 Extended production chains — new facilities and production options beyond vanilla.

Economy Mods

Name	Author	Source	Version	Notes
Volatile Economy	—	fs25.net	Beta 2	 Carried forward from Wave 1. Dynamic supply/demand at max difficulty is punishing.
Enhanced Economy Settings	—	ModHub	—	 Adjustable prices at buy/sell points, production points, animal dealers.

Carried Forward from Wave 1

- WINERY ([fs25.net](#)) — optional secondary production chain
- Brewery and Hop Plantation ([fs25.net](#)) — optional secondary production

- Tax Mod (fs25.net) — increased tax burden at Wave 2 income levels

Wave 2 — Gameplay & Difficulty

Mods added in this wave beyond Waves 0 and 1.

Advanced Vehicle Maintenance

Name	Author	Source	Version	Notes
Advanced Damage System	—	fs25.net , GitHub	0.9.2.7	[!] Deep maintenance gameplay. Service cost scales with condition. July 2026.

AI Worker Management

Name	Author	Source	Version	Notes
Advanced Helper	—	fs25.net	1.3.0.4	[!] Employee management system. Workers have unique skills. Hire/fire/manage. June 2026.

Difficulty

Name	Author	Source	Version	Notes
Hardcore Balance Mod	—	ModHub	—	 Increased difficulty — adjusts economy and progression.

Max Difficulty Settings

Apply these in-game difficulty settings for Wave 2:

Setting	Value
Economic Difficulty	Hard
Plant Growth	Slow
Fuel Usage	On
Traffic	On
Auto-Repair	Off
Seasons	On
Plowing Requirement	On
Weeds	On
Stones	On
Lime	On

Carried Forward from Wave 1

- **CoursePlay** (ModHub #331515) — vehicle automation at industrial scale
- **Precision Farming 3.0** (ModHub #318936) — smart farming
- **WayPoint GPS** (fs25.net) — GPS routing
- **Volatile Economy** (fs25.net) — dynamic markets at hard difficulty
