Wave 0 — First Lap

Roleplaying Background: You're a rookie driver, fresh out of karting. You've never turned a wheel in a Formula 1 car. The team will teach you everything — from what the buttons on the wheel do, to surviving your first race weekend. Take it slow. Absorb it all. Everyone starts somewhere.

0.1 — Getting Started

Installing F1 25

F1 25 is available on Steam, EA App, and Epic Games Store. Install via your platform of choice and ensure the game is updated to **v1.24** (released July 13, 2026).

Verify your version in the main menu — it appears in the bottom-right corner.

Simplified Launcher Setup

The **Simplified Launcher** by Team Simplified is the recommended mod manager for F1 25. It installs, manages, and launches mods without touching your original game files.

Detail	Value
Download	Simplified Launcher for F1 25 v3.2.10
Author	Team Simplified
Support	Team Simplified Discord
Tutorial	YouTube — Simplified Launcher v3.0 Tutorial

Installation Steps:

1. Download the Simplified Launcher from OverTake.gg (requires a free OverTake.gg account)
2. Extract the ZIP file to a folder of your choice (e.g., `C:\Tools\SimplifiedLauncher`)
3. Run `SimplifiedLauncher.exe`
4. Set your F1 25 game directory when prompted — this is where F1 25 is installed:
 - Steam: `C:\Program Files (x86)\Steam\steamapps\common\F1 25`
 - EA App: `C:\Program Files\EA Games\F1 25`
 - Epic: `C:\Program Files\Epic Games\F1 25`
5. The launcher is now ready. No mods are needed for Wave 0 — we'll add them in Waves 1 and 2.

Note: Some antivirus software may flag the Simplified Launcher as a false positive. The developer confirms this is due to Python self-packaging

without a code signing certificate. The tool is safe to use — add an exception if needed.

Key Features (for later waves):

- **Drag and drop** mod archives onto the app to install
- **Backup and restore** — original game files are backed up before mod installation, restored when you quit
- **Clean online play** — when not using the launcher, your game is completely vanilla
- **Presets** — save mod combinations and share them with friends
- **Categories** — organize mods into folders (My Team, Helmets, etc.)
- **Conflict detection** — prevents two mods that replace the same files from launching together

Verification note: The controls, assists, and game mechanics described below are written from F1 series knowledge. Specific F1 25 v1.24 menus, default bindings, and feature names should be verified against the actual game in a future pass.

0.2 — Controls

Controller vs Wheel

You can play F1 25 with either a **controller** (Xbox, PlayStation) or a **racing wheel**. Both are fully viable.

Controller — The default input method. Good for learning and casual play. The game's assist systems compensate for the lack of precision.

Racing Wheel — Provides force feedback, finer steering control, and a more immersive experience. Recommended if you're serious about sim racing, but not required to enjoy or complete the game.

Essential Controls (Controller)

Input	Action
Left Stick	Steer
Right Trigger (RT)	Accelerate
Left Trigger (LT)	Brake
A (Xbox) / X (PS)	Overtake (ERS boost)
B (Xbox) / Circle (PS)	DRS (when available)
X (Xbox) / Square (PS)	Change ERS mode

Input	Action
Y (Xbox) / Triangle (PS)	Pit limiter / request pit stop
D-Pad Left/Right	Change MFD panel
D-Pad Up/Down	Adjust within MFD panel
Left Bumper (LB)	Look back
Right Bumper (RB)	Change camera
Menu/Options	Pause

Essential Controls (Wheel)

If you have a wheel, customize bindings in **Settings > Controls > Custom**. At minimum, bind:

- Upshift / Downshift (paddles)
- Overtake button
- DRS button
- MFD navigation (rotary or D-Pad)
- Pit limiter

Calibration

Before your first drive:

1. Go to **Settings > Controls > Calibration**
2. Follow the on-screen prompts to calibrate steering, throttle, and brake
3. For wheel users: set **Steering Rotation** to 360 degrees for F1 cars

0.3 — Assists

F1 25 offers a range of driving assists that make the car easier to control. As a complete beginner, use them. You can reduce or disable them as you improve.

Recommended Beginner Assist Preset

Assist	Setting	Why
Steering Assist	Off	Can fight your inputs — leave off even as a beginner
Braking Assist	Off	Learn to brake yourself from day one
Anti-Lock Brakes (ABS)	On	Prevents wheel lock under braking
Traction Control	Medium	Prevents wheelspin on throttle; Full TC is too invasive
Dynamic Racing Line	Corners Only	Shows braking and turn-in points without cluttering straights
Gearbox	Automatic	Focus on steering and braking first

Assist		Setting		Why	
Pit Assist		On		Handles pit entry/exit for you	
Pit Release Assist		On		Releases you into safe gaps	
ERS Assist		On		Manages deployment automatically	
DRS Assist		On		Opens DRS automatically when available	

When to reduce assists: Once you can consistently complete a race weekend without spinning or crashing, start reducing. Suggested order: Traction Control to Low, then Gearbox to Manual (Suggested), then ABS Off, then ERS to Manual.

0.4 — Driving Basics

The Racing Line

The racing line is the fastest path through a corner. It follows this pattern:

1. **Approach** from the outside of the track
2. **Turn in** toward the apex (the innermost point of the corner)
3. **Clip the apex** — get as close to the inside curb as possible
4. **Track out** to the outside on exit, using the full width of the track

Braking

- Brake in a straight line **before** the corner, not during
- Release the brake smoothly as you turn in (this is called “trail braking” — practice it later)
- If you’re locking wheels, brake earlier and with less pressure, or enable ABS

Throttle Application

- Apply throttle smoothly on corner exit
- Going full throttle too early causes wheelspin and sliding — wait until the car is straightened
- With Traction Control on Medium, the game will help manage this

Corner Types

Type	Speed	Approach
Hairpin	Very slow	Hard braking in a straight line, late apex, patience on throttle
Medium-speed	Moderate	Light brake or lift, smooth turn-in, early throttle
High-speed	Fast	Brief lift off throttle, minimal steering input, full throttle early

Type	Speed	Approach
Chicane	Slow-medium	Brake for first part, attack the curbs, quick direction change

Practice

Start with **Time Trial** mode. Pick a track (Bahrain is a good starter — wide, forgiving, mix of corner types). Drive laps. Watch the delta timer — green means you're faster than your best, red means slower. Aim for consistency, not hero laps.

0.5 — Race Weekend Structure

A Formula 1 race weekend follows this format:

Standard Weekend (most races)

Session	Duration	Purpose
FP1 (Free Practice 1)	60 minutes	Learn the track, test setups, run long-run pace
FP2 (Free Practice 2)	60 minutes	Qualifying simulations, race pace runs
FP3 (Free Practice 3)	60 minutes	Final setup tweaks, short qualifying simulations
Qualifying	Q1/Q2/Q3 format	Set your grid position
Race	~305 km / ~90 minutes	The main event

Sprint Weekend (select races)

Sprint weekends replace one practice session with a shorter race on Saturday:

Session	Duration
FP1	60 minutes
Sprint Qualifying	SQ1/SQ2/SQ3 (shorter format)
Sprint Race	~100 km / ~30 minutes
Race	Full distance

Qualifying Format (Q1/Q2/Q3)

- **Q1 (18 minutes):** All 20 drivers — slowest 5 eliminated (positions 16-20)
- **Q2 (15 minutes):** 15 fastest from Q1 — slowest 5 eliminated (positions 11-15)
- **Q3 (12 minutes):** 10 fastest from Q2 — fight for pole position (positions 1-10)

You get one set of tyres per qualifying segment. Plan your runs — go out early to set a banker lap, then improve on a second run when the track has more grip.

0.6 — Tyres 101

F1 uses Pirelli tyres in six compounds per race weekend:

Compound	Colour	Use Case	
Soft	Red	Fastest, most grip, wears out fastest — used in qualifying	
Medium	Yellow	Balanced grip and durability — most common race tyre	
Hard	White	Least grip, most durable — used for long stints	
Intermediate	Green	Light rain, damp track	
Full Wet	Blue	Heavy rain, standing water	

Key Concepts:

- **Degradation** — tyres lose grip as they wear. You'll feel the car slide more as tyres age.
 - **Temperature window** — tyres work best in a narrow temperature range. Too cold = no grip. Too hot = rapid wear.
 - **Pit stops** — you must use at least two different compounds in a dry race. A typical strategy is Medium -> Hard, or Soft -> Medium -> Soft.
 - **Undercut** — pitting earlier than your rival to gain position through fresh-tyre pace.
-

0.7 — ERS 101

The Energy Recovery System (ERS) harvests energy from braking and the turbocharger, storing it in a battery for deployment as extra horsepower.

Deployment Modes (with ERS Assist On, automatic):

- **None / Hotlap** — The game manages this. Don't worry about it in Wave 0.

Overtake Button:

- Press the Overtake button for a burst of maximum ERS deployment
- Use it on straights when attacking or defending position
- Battery depletes with use — it recharges under braking

In Wave 0 with ERS Assist On, the game handles all ERS management. Press Overtake when you need a burst of speed. That's it.

0.8 — Career Mode

Career Mode lets you create your own driver and compete through F1 seasons.

Starting Your Career

1. **Create Your Driver** — name, nationality, helmet design, number
2. **Choose Starting Point:**
 - **F2 Start** — race in Formula 2 first, earn a superlicence, then join F1. More immersive.
 - **F1 Start** — jump straight into F1 with a midfield or backmarker team. Faster path.
3. **Choose Your Team** — as a beginner, pick a midfield team (Aston Martin, Alpine, RB) or a backmarker (Williams, Kick Sauber). Don't start at Red Bull or McLaren — the expectations are too high.

R&D (Research & Development)

Between races, you earn **Resource Points** to upgrade your car. Categories:

- **Aerodynamics** — front wing, rear wing, floor, sidepod (improves cornering speed)
- **Chassis** — weight reduction, suspension (improves handling)
- **Powertrain** — engine, ERS, gearbox (improves straight-line speed)
- **Durability** — component wear reduction (fewer grid penalties)

Tips:

- Focus on one department per season — spreading points too thin makes little difference
- Aero upgrades are generally the most impactful
- Powertrain components wear over races — when one fails, you take a grid penalty for replacing it

Practice Programmes

During Free Practice sessions, complete programmes to earn Resource Points:

- **Track Acclimatisation** — drive through gates on the racing line
- **Tyre Management** — complete laps while keeping tyre temperatures in the green zone
- **Fuel Management** — complete laps while hitting a fuel efficiency target
- **Qualifying Simulation** — set a fast lap; your time predicts your qualifying pace
- **Race Strategy** — complete long runs to estimate tyre wear and race pace

Each completed programme awards Resource Points. You don't need to ace all of them — even partial completion earns points.

0.9 — UI Tour

MFD (Multi-Function Display)

The MFD is the screen on your steering wheel or HUD. Use D-Pad Left/Right to cycle panels:

Panel	Shows
Strategy	Tyre wear, fuel delta, pit window, weather forecast
Tyres	Per-tyre temperature and wear percentage
ERS	Battery level, deployment mode, energy harvested per lap
Fuel	Fuel remaining, fuel mix mode, fuel delta to target
Damage	Component wear and damage status
Race Info	Position, gaps to cars ahead/behind, lap times

Timing Screen (Pause Menu)

Pause during a session to see:

- Full timing table with gaps and tyre compounds
- Race director messages (penalties, flags, safety car)
- Session standings

Engineer Radio

Your race engineer gives you information during the race:

- Gaps to cars ahead and behind
- Tyre and brake temperature warnings
- Weather updates
- Pit window and strategy calls
- Traffic information

You can request specific information from the engineer via the MFD request menu (D-Pad).

Wave 0 Mods

For Wave 0, the only tool you need is the **Simplified Launcher** — and even that is optional at this stage. The goal of Wave 0 is to learn the game vanilla. No gameplay mods.

If you're eager to explore the mod ecosystem, see [Wave 1 Mods](#).

Wave 0 Mods — Tools & Launcher

Wave 0 uses no gameplay mods. The only tool is the Simplified Launcher, which is used to manage mods in later waves. It's introduced here so you're familiar with it before adding content mods.

Simplified Launcher for F1 25

Detail	Value
Version	v3.2.10
Author	Team Simplified
Dependencies	None
What It Changes	Manages mod installation, backup, and launching for F1 25. Drag-and-drop mod archives (ZIP/RAR/7Z). Automatically backs up and restores original game files. Supports mod categories, favorites, presets, and conflict detection.
Installation	Download from OverTake.gg. Extract to any folder. Run SimplifiedLauncher.exe . Set your F1 25 game directory. No gameplay mods are installed in Wave 0 — the launcher is set up here for use in Waves 1 and 2.

Wave 1 — Building Speed

Roleplaying Background: You've completed a season in F1. You've scored points, maybe even stood on a podium. But the car still feels like it holds secrets from you. The telemetry screens in the garage look like alien language. Time to peel back the first layer. Time to understand what the machine is actually doing.

1.1 — Driving Technique

Trail Braking

Trail braking is the technique of gradually releasing the brake as you turn into a corner, rather than completing all braking in a straight line. It shifts weight to the front tyres during turn-in, improving front-end grip and rotation.

How to practice:

1. Approach the corner and brake hard in a straight line (80-90% pressure)
2. Begin turning in while releasing brake pressure to ~20-30%
3. Trail the brake off completely as you reach the apex
4. Apply throttle on exit

Start with medium-speed corners (Turn 1 at Bahrain, Turn 4 at Spain). Don't try this on hairpins until you're comfortable.

Corner Exit Priority

In Formula 1, corner exit is more important than corner entry. A fast exit means higher speed on the following straight, which compounds into lap time. Sacrifice a tiny bit of entry speed to get a better exit.

The rule: "Slow in, fast out." It's a cliché because it's true.

Weight Transfer

Every input shifts the car's weight:

- **Braking** shifts weight forward — more front grip, less rear grip (rear can slide)
- **Accelerating** shifts weight rearward — more rear grip, less front grip (understeer)
- **Steering** shifts weight to the outside tyres

Use weight transfer deliberately. A slight lift off the throttle before turn-in shifts weight forward for better rotation. A touch of throttle mid-corner settles the rear.

1.2 — Intermediate Car Setup

Car setup determines how the car behaves. Each track demands different compromises. Here are the key parameters you can adjust and what they do.

Aerodynamics (Front Wing / Rear Wing)

Change	Effect
More wing	More downforce — better cornering grip, lower top speed
Less wing	Less downforce — higher top speed, less cornering grip

Rule of thumb: High-downforce for Monaco, Singapore, Hungary. Low-downforce for Monza, Spa, Baku. Balanced for most other tracks.

Front vs Rear balance: If the car understeers (won't turn), add front wing. If it oversteers (rear slides), add rear wing or reduce front wing.

Differential (On-Throttle / Off-Throttle)

The differential controls how the rear wheels rotate relative to each other.

Setting	On-Throttle Effect	Off-Throttle Effect
Lower %	Less lock — better rotation mid-corner, easier to turn	Less lock — more rear instability on entry
Higher %	More lock — more traction on exit, more understeer	More lock — more stability under braking

Starting point: 50-60% on-throttle, 50-55% off-throttle. Adjust based on feel.

Brake Bias

Brake bias distributes braking force between front and rear.

Bias	Effect
More front %	More stable under braking, less rotation
More rear %	Better turn-in rotation, risk of rear locking

Tip: Move brake bias rearward (lower %) for tracks with slow corners where you need the car to rotate. Keep it forward for high-speed braking zones.

Brake Pressure

Higher pressure = more braking force, but easier to lock wheels. Lower pressure = more modulation control.

With ABS On: 100% is fine. With ABS Off: 85-95% typically. Lower for wet conditions.

1.3 — ERS Strategy

With **ERS Assist Off** (manual mode), you control when the battery deploys and harvests.

Deployment Modes

Mode	Behaviour
None	No deployment — battery charges from braking/turbo
Medium	Balanced deployment and harvesting
Hotlap	Maximum deployment — fastest but drains battery quickly
Overtake	Maximum deployment while button is held — use in bursts

Per-Track Strategy

Each track has unique deployment zones. The general approach:

1. **Harvest on corner entry** (braking zone = free energy)
2. **Deploy on corner exit and straights** (where speed matters most)
3. **Save battery for overtaking/defending** — don't arrive at a battle with 0% charge

Qualifying: Hotlap mode for the entire lap. Manage battery so you don't hit 0% before the finish line.

Race: Medium mode for most of the lap. Switch to Hotlap when attacking or defending. Switch to None in dirty air (saving battery) or when fuel-saving.

1.4 — Fuel Management

Fuel load affects car weight significantly. A full tank at race start makes the car slower and harder to handle. As fuel burns off, the car becomes faster.

Fuel Mix Modes

Mix	Consumption	Pace
Rich	Highest	Fastest
Standard	Normal	Normal
Lean	Lowest	Slowest

Race strategy:

- Start on Standard mix
 - Switch to Rich when attacking or in clean air chasing lap time
 - Switch to Lean when saving fuel (behind a safety car, or if you're fuel-negative)
 - Lift and coast into heavy braking zones to save additional fuel (lift off throttle before braking point)
-

1.5 — Tyre Management

Temperature Windows

Each compound has an optimal temperature window. The game's tyre HUD shows per-tyre temperatures:

- **Blue** = too cold, no grip
- **Green** = optimal temperature
- **Red** = overheating, rapid wear

Managing temperatures:

- Weaving on straights warms tyres
- Smooth steering keeps temperatures stable
- Aggressive sliding overheats tyres rapidly
- Driving in dirty air (behind another car) reduces front-end cooling

Graining vs Blistering

- **Graining** — tyre surface tears and re-sticks unevenly. Caused by sliding on a cold tyre. Heals as tyre wears and temperatures rise.
 - **Blistering** — air pockets form inside the tyre from overheating. Does not heal. Manage by driving smoother.
-

1.6 — AI Calibration

Finding the right AI difficulty is crucial for realistic racing. The game uses a 0-110 scale.

Goal: Qualify and race around your teammate's pace. If you consistently beat your teammate by 5+ positions, raise AI. If you're always last, lower it.

Per-track adjustment: AI strength varies by track. You may need 105 at Bahrain but 95 at Monaco. Don't be afraid to adjust per-race.

General starting points:

- Controller + full assists: 40-60
 - Controller + minimal assists: 60-80
 - Wheel + no assists: 80-100
 - Experienced sim racer: 100-110
-

1.7 — Race Strategy

Undercut

Pitting earlier than the car ahead to gain track position. Your fresh tyres give you pace while they're still on old tyres. When they pit, you emerge ahead.

When to undercut: When you're within 1-2 seconds of the car ahead and tyres are dropping off.

Overcut

Staying out longer while others pit. If you have clean air and good pace on old tyres, you can build a gap and emerge ahead after your stop.

When to overcut: When you have clean air, good pace, and the track is clear ahead.

Safety Car Strategy

A Safety Car bunches the field. Free pit stop — you lose less time pitting under SC than under green flag conditions. If a SC is deployed and you're near your pit window, pit immediately.

Weather Strategy

- **Radar is your friend** — check the weather radar on the MFD
- **Inters vs Wets** — cross the line between them carefully. Inters on a drying track are faster than Wets. Wets in heavy rain prevent aquaplaning.
- **Timing the switch** — pitting one lap earlier or later for tyres can gain or lose 5+ positions in changing conditions

Wave 1 Mods

Strategy, Cameras, Telemetry, AI, Liveries

Wave 1 introduces your first gameplay mods. These enhance the experience without fundamentally changing the game's mechanics.

Mods to be inserted here by Task 5. Categories: Telemetry/Dashboards, Cameras, Liveries, AI Tweaks. Each entry uses the standard format from AGENTS.md.

Wave 2 — Apex Predator

Roleplaying Background: You don't just drive the car anymore — you define it. Every click of wing angle, every tenth of a psi, every suspension millimeter is a deliberate choice. You don't react to strategy — you script it before the lights go out. The car is an extension of your will. Now make it sing.

2.1 — Advanced Car Setup

By now, you understand the basics of wings, differential, and brake bias. Advanced setup is about the fine details — the relationships between parameters that experienced engineers spend careers mastering.

Full Aerodynamic Map

The front and rear wings don't exist in isolation. Their relationship to ride height, suspension stiffness, and tyre pressures creates the car's aerodynamic platform.

Parameter	Aero Effect
Lower front ride height	Increases front downforce — better turn-in, risk of bottoming
Higher rear ride height	Increases rear downforce — more stability, more drag
Rake (rear higher than front)	Increases overall downforce — gives the diffuser more air to work with
Stiff front suspension	Maintains aero platform, less mechanical grip
Soft rear suspension	Better rear traction, risk of aero instability

Principle: Change one thing at a time. If you change rear wing, front ride height, and differential all at once, you won't know what improved or ruined the car.

Suspension Kinematics

Parameter	More (Higher Setting)	Less (Lower Setting)
Front Camber	Better mid-corner front grip, worse braking stability	Better braking, less cornering grip
Rear Camber	Better rear grip on exit, less straight-line traction	More straight-line stability, less corner grip

Parameter	More (Higher Setting)	Less (Lower Setting)
Front Toe	Toe-out = better turn-in response	Toe-in = more stability
Rear Toe	Toe-in = stability under braking	Toe-out = better rotation
Front Anti-Roll Bar	More understeer, sharper response	Less understeer, smoother response
Rear Anti-Roll Bar	More oversteer on entry	Less oversteer, better traction

Ride Height & Rake

Ride height directly affects aerodynamics. Lower = more downforce from the floor, but risk of bottoming out on bumps and kerbs. Bottoming causes sudden loss of downforce — dangerous in high-speed corners.

Ride height targets (mm):

- Monaco / Singapore: Higher (45-50mm) — bumpy, lots of kerbs
- Monza / Spa: Lower (35-40mm) — smooth, high-speed, need low drag
- Most tracks: 40-45mm front, 50-55mm rear (3-8mm rake)

Corner Weight & Balance

Corner weights aren't adjustable in F1 25's setup screen directly, but ballast (if available in career) and asymmetric setups matter:

- More weight on the left side helps clockwise circuits (most F1 tracks)
- Adjust tyre pressures per-side for asymmetric tracks (e.g., higher right-side pressures at clockwise tracks)

2.2 — Qualifying Mastery

Track Evolution

The track gets faster as rubber is laid down. Q3 is typically 1-2 seconds faster than Q1 on the same tyre compound. Plan your runs knowing the track will improve.

Tow Strategy

Running behind another car on a straight gives you a slipstream (tow) — worth 0.2-0.4 seconds. In qualifying, teams coordinate to give their drivers tows. As a solo player:

- If you're behind a faster car on a straight, stay in their slipstream
- Don't follow too closely in corners — dirty air reduces downforce more than the tow is worth

One-Lap Preparation

Out lap:

- Weave aggressively to bring tyres to temperature
- Manage battery — arrive at the start line with 100% charge
- Build gap to the car ahead — 5+ seconds for clean air

Hot lap:

- ERS in Hotlap mode
- Rich fuel mix
- Use every inch of track — curbs are your friend (except sausage kerbs — avoid those)

Cooldown lap:

- Harvest energy in EV-only or low deployment mode
- Stay off the racing line so you don't impede others

2.3 — Wet Weather Racing

Inters vs Full Wet Crossover

The crossover point where Full Wets become faster than Inters depends on track and conditions:

Condition	Tyre
Damp track, no spray	Inters
Light rain, light spray	Inters (they clear water adequately)
Standing water visible	Full Wets
Heavy spray, poor visibility	Full Wets
Drying line appearing	Inters are faster — switch early

Key indicator: If the AI starts pitting for Wet tyres, you probably should too.

Driving in Wet Conditions

- Brake earlier and with less pressure — grip is reduced
- Use higher gears — short-shift to reduce wheelspin
- Avoid kerbs and painted lines — they're extremely slippery when wet
- Aquaplaning: if the car suddenly floats and steering goes light, lift off gently, don't brake
- The racing line is the most rubbered-in part of the track — it can actually be MORE slippery in very wet conditions. The offline line may have more grip.

Setup Changes for Wet

Parameter	Dry Setup	Wet Adjustment
Wings	Track-dependent	Add 2-4 clicks front and rear
Ride Height	Low	Raise 5-10mm (avoid bottoming with less downforce from slower speeds)
Brake Pressure	95-100%	Reduce to 85-90%
Brake Bias	Track-dependent	Move forward 2-3% (more stability)
Differential (on-throttle)	Track-dependent	Reduce 10-15% (less wheelspin on exit)
Tyre Pressures	Optimal	Increase slightly (tyres run cooler)

2.4 — Custom Championships

F1 25 allows you to create custom championship seasons with modified calendars, regulations, and cars.

Building a Custom Season

1. Go to **Solo > Custom Championship**
2. Choose the number of races (full 24-race calendar, or a mini-season)
3. Select tracks — try themed seasons:
 - **European Tour:** Silverstone, Spa, Monza, Monaco, Barcelona, Zandvoort
 - **Asian Swing:** Suzuka, Singapore, Shanghai, Baku, Yas Marina
 - **Americas:** COTA, Mexico, Interlagos, Montreal, Miami, Las Vegas
4. Set regulations: points system, parc ferme rules, qualifying format
5. Choose cars: equal performance or realistic (team performance differences)

2.5 — Data Analysis

Reading Telemetry

Telemetry comparison is how real drivers find lap time. F1 25 doesn't have a built-in telemetry tool, but third-party tools (SimHub, custom dashboards) can export data.

What to compare (vs your best lap or a faster ghost):

1. **Throttle trace** — are you getting to full throttle later than optimal?
2. **Brake trace** — are you braking too early? Too hard? Trailing properly?
3. **Speed trace** — where are you losing minimum speed mid-corner?
4. **Steering trace** — are you sawing at the wheel? Smooth inputs = faster laps.

Identifying Time Loss

1. Find the corner where you lose the most time (use delta comparison)

2. Focus on that one corner for 5-10 laps
3. Try different lines, braking points, and throttle applications
4. Move to the next corner only after you've improved

Typical patterns:

- Losing time on entry = braking too early or too hard
- Losing time mid-corner = not enough minimum speed, or too much steering angle
- Losing time on exit = getting on throttle too late, or too aggressively

Wave 2 Mods — Physics, Career, Visuals, Audio

Wave 2 introduces deeper mods that change game mechanics and visuals.

Mods to be inserted here by Task 5. Categories: Physics/Handling, Career Enhancement, Graphics/Visual, Audio. Each entry uses the standard format from AGENTS.md.
