Installation Guide

Prerequisites

- A legitimate copy of GTA IV — Steam “Grand Theft Auto IV: The Complete Edition” (v1.2.0.30+), Rockstar Games Launcher, or a retail copy.
- Target patch: *1.0.8.0* (the modlist’s compatibility target).
- 20 GB free disk space.
- Windows 7 or later (Windows 10/11 recommended).

Step 1: Install GTA IV

Install the game normally (Steam or Rockstar Games Launcher). The Complete Edition ships as 1.2.0.30+; the modlist targets *1.0.8.0*, so most players downgrade first (Step 2).

Step 2: Downgrade to 1.0.8.0 (Complete Edition owners)

Use the GTA IV Downgrader by ClonkAndre (v2.2):

1. Download the latest release from GitHub (also on Nexus Mods and GTAForums).
2. Run the tool and point it at your GTA IV installation.
3. In the version-selection step, choose *1.0.8.0* (selected by default).
4. Recommended: enable the *radio downgrade* to restore the songs cut from the Complete Edition (see Wave 1 → Audio).
5. Complete the downgrade. The tool offers automatic backup and an optional `commandline.txt`.

If you already own a retail copy patched to 1.0.8.0, skip this step.

Step 3: FusionFix (required for both waves)

FusionFix by ThirteenAG (v5.0.1) is the base compatibility, bug-fix, and QoL framework.

> *Important:* FusionFix fully supports the Complete Edition. On *1.0.8.0* it additionally requires the *Legacy Addon*.

1. Download `GTAIV.EFLC.FusionFix.zip` from the latest release.
2. Download `GTAIV.EFLC.FusionFixLegacyAddon.zip` from the same release page.
3. Extract the main archive to your GTA IV root folder (where the game executable lives), overwriting when prompted.
4. Extract the Legacy Addon to the same folder, overwriting when prompted.
5. Launch the game once to verify.

FusionFix bundles the Ultimate ASI Loader (ThirteenAG), so no separate ASI loader is needed.

Verifying FusionFix is working

- Launch GTA IV, pause, and open *Settings*. A new FusionFix options screen (Display / Graphics / Game / Audio / Controls) should be present.
- Quick checks: the *FOV* slider and the *FPS Limiter* are both present and functional.

Step 4: Mod Installation Order

When installing mods, follow this order to avoid conflicts:

1. *FusionFix* (+ Legacy Addon) — always first.
2. *Script frameworks* — IV-SDK.NET (Wave 1) and any dependency mods.
3. *Graphics mods* — texture packs, shaders (applied last to avoid overwrites).
4. *Content mods* — vehicles, weapons, map additions.
5. *Mechanics mods* — physics, AI, damage models.

6. *Audio mods* — radio, sound effects.
7. *Configuration edits* — .ini and .xml tweaks.

Asset mods (vehicles, weapons, textures) are installed with OpenIV, the standard editor for GTA IV's .img/.wdr archives. Install OpenIV once, then use it to open and edit the game's archive files per each mod's instructions.

Step 5: First Launch

1. Launch the game executable.
2. Open *Graphics* settings and set:
 - Resolution: your monitor's native resolution.
 - Texture Quality: High.
 - View Distance: 30–40 (adjust for performance).
3. Open *Controls* and configure bindings to preference.
4. Start a new game to verify everything works.

Troubleshooting

| Problem | Solution | |---|---| | Game crashes on startup | Confirm FusionFix *and* the Legacy Addon are installed (1.0.8.0 needs both). Check Documents\Rockstar Games\GTA IV\ for logs. | | No FusionFix menu in Settings | The Legacy Addon is missing, or the wrong game version was selected during downgrade. | | Black screen on launch | Try windowed mode (-windowed launch parameter). | | Low FPS | Reduce View Distance and Shadow Quality; lower the FusionFix FPS limiter. | | Missing textures | Set Texture Quality to High or Medium. | | Controls not working | Verify bindings in Settings → Controls, then reinstall FusionFix. |

Wave 0: Fresh Off the Boat — Mod List

> Roleplaying Theme: New immigrant arrives in Liberty City. You have no connections, no reputation, and no resources. You take odd jobs and learn the city's rhythms.

> *Scope*: UI improvements and quality-of-life fixes only. No graphics overhauls, no content additions, no mechanic changes. FusionFix provides all compatibility fixes.

> *Installation*: All mods below are installed on top of a clean GTA IV 1.0.8.0 with FusionFix (+ Legacy Addon) already applied.

—

Wave 0 Foundation

Wave 0 is carried by a single framework: *FusionFix*. Because it already contains nearly every quality-of-life and UI fix the community used to install as separate mods, this wave is intentionally light.

FusionFix

| Field | Value | |---|---| | *Version* | v5.0.1 (+ Legacy Addon for 1.0.8.0) | | *Author* | ThirteenAG | | *Dependencies* | Ultimate ASI Loader (bundled) | | *System Impact* | Bug fixes, UI/QoL options, graphics fixes |

The base compatibility and quality-of-life framework. Fixes long-standing PC-port bugs (z-fighting, broken bloom/motion-blur scaling, the inverted “Definition” blur, broken soft particles, missing neon lights) and adds an in-game options menu.

Install via the installation guide (Step 3). On 1.0.8.0 the *Legacy Addon* is required.

What FusionFix covers in Wave 0

The features below are this wave's UI/QoL content — no separate mods are needed for them.

UI & display

- FOV slider, transparent map menu, FPS counter, skip intro / skip main menu
- Windowed / borderless windowed, pause on focus loss, letterbox & pillarbox controls
- Controller icon styles (Xbox 360/One, PS3/PS4/PS5, Switch, Steam Deck)

Controls & feel

- Raw mouse input, mouse look/aim sensitivity, always-run toggle
- Turn indicators, instant taxi stop, disable wardrobe transition
- Centered on-foot and vehicle camera

Bug fixes (selection)

- Frame-rate fixes (physics and animation no longer break above 30 FPS)
- Recoil consistency between keyboard/mouse and gamepad
- Cutscene "Definition" and DLC car-light fixes
- Ultrawide support

—

Additional UI / QoL Mods (user to provide)

> *Why these are open:* standalone GTA IV UI/QoL mods have largely been absorbed into FusionFix. Adding a separate QoL mod now risks redundancy or conflict — add only mods that do something FusionFix does not.

User to provide — UI improvement

Field	Value	Version	Dependencies	FusionFix	System Impact

Slot for a standalone UI mod not covered by FusionFix.

User to provide — Audio / QoL

Field	Value	Version	Dependencies	FusionFix	System Impact

Slot for a standalone audio or quality-of-life mod not covered by FusionFix.

—

Already covered — do not add

- *IV Centered Vehicle Cam / OnFoot Cam* (gennariarmando) — merged into FusionFix; installing separately is redundant.
- *ZolikaPatch* — overlaps FusionFix; requires disabling 30 overlapping options to avoid conflicts, so it is excluded from the list.

Wave 0: Fresh Off the Boat — How to Play

> *The container ship's horn drowns out the city noise as you step onto the dock at Port Tudor. You have a duffel bag, a burner phone, and an address scrawled on a napkin. Liberty City stretches before you — towering, filthy, alive. Somewhere in this concrete maze, you'll find your footing. Or it'll bury you.*

—

Getting Started

Understanding Liberty City

Liberty City is divided into four boroughs:

- *Broker* — starting area, loosely based on Brooklyn. Your first missions are here.
- *Bohan* — loosely based on the Bronx/Bedford-Stuyvesant. Unlocked early in the story.
- *Algonquin* — the central island, loosely based on Manhattan. The heart of the city.
- *Alderney* — loosely based on New Jersey. Unlocked later in the story.

Your first several hours will be in Broker. Take time to explore, learn the streets, and understand the traffic patterns.

Controls Reference (Default)

| Action | Keyboard | Controller | |---|---|---| | Move | WASD | Left stick | | Sprint / Accelerate | Shift (tap) | Right trigger | | Enter/Exit vehicle | F | Y/Triangle | | Handbrake | Space | A/X (Xbox) / R1 (PS) | | Weapon wheel | Tab | LB/L1 | | Phone | Up arrow | D-pad up | | Cover | Q | RB/R1 | | Aim | Right mouse button | Left trigger | | Shoot | Left mouse button | Right bumper | | Change radio | Scroll wheel / N | D-pad left/right |

The Phone

Your phone is your mission hub. Roman calls to start story missions. You can also:

- *Call contacts* to request services (cab, backup, etc.)
- *Answer calls* to receive mission briefings
- *Ignore calls* — most calls have no penalty for ignoring
- *Check your phone* at any time with the Up arrow

> *Tip:* Answer calls promptly. If you miss one, check your phone's recent calls to call back.

—

Core Mechanics

Driving

GTA IV's driving physics are simulation-leaning. Key principles:

- *Brake before turns* — braking mid-turn causes understeer
- *Tap the handbrake* (Space) for sharp turns, but use it sparingly
- *Heavier vehicles* (SUVs, trucks) handle worse but protect you in crashes
- *Faster vehicles* (sports cars) oversteer easily — feather the throttle
- *Motorcycles* are extremely nimble but the slightest collision throws you off
- *Traffic laws don't apply* but aggressive driving damages your vehicle

Combat

- *Use cover* (Q to take cover, then aim and shoot from behind it)
- *Headshots* are instant kills with most weapons
- *Pistol* — accurate at close-mid range, your go-to weapon
- *SMG* — spray for suppressive fire, not accuracy
- *Shotgun* — devastating up close, useless at range
- *Assault Rifle* — best all-around weapon, available later
- *Grenades* — excellent for groups in cover, dangerous up close
- *Melee* — free, silent, effective against single targets
- *Sniper Rifle* — extreme range, one-hit kills, limited ammo

Wanted System

Six levels of police response:

| Level | Response | |---|---| | ★ | One patrol car, passive search | | ★★ | 2-3 patrol cars, active pursuit | | ★★★ | Roadblocks, helicopters start arriving | | ★★★★ | Aggressive pursuit, more roadblocks | | ★★★★★ | FBI, spike strips, heavy response | | ★★★★★★ | Army, near-impossible to escape |

To lose the cops:

1. *Break line of sight* — duck into alleys, subways, or buildings
2. *Hide* — wait for the search radius to shrink
3. *Change your vehicle* — cops track your last known vehicle
4. *Pay ‘n’ Spray* — resprays your car and drops wanted level (not available at ★★★★★+)

Money

- Early game money is tight
- Missions pay modestly until later chapters
- Side activities (pool, darts, bowling) earn tiny amounts
- Taxi work is the most reliable early income
- *Don’t buy weapons you don’t need* — ammo is expensive

—

Tips for Wave 0

1. *Learn the map* without GPS waypoints at first. The street signs and landmarks are designed to be navigable.
2. *Do Roman’s taxi missions early* — they pay reliably and teach you the streets.
3. *Save often* — use your safehouse bed to save before difficult missions.
4. *Check your email* at internet cafes for side missions and opportunities.
5. *Don’t rush* — the game’s strength is its atmosphere. Walk, drive slow, listen to the radio.
6. *Use pedestrians as guides* — ask for directions (press E near them) to get waypoints marked on your radar.
7. *Get off the main roads* — alleys and shortcuts are faster than following GPS.

Wave 1: City of Dreams — Mod List

> *Roleplaying Theme:* You’ve made a name for yourself. The immigrant who stepped off that boat is gone — now you have enemies, allies, and a reputation. The city is yours for the taking, but the higher you climb, the harder they’ll fight to bring you down.

> *Scope:* Graphics, content, and mechanics mods that transform the game into a harder, richer experience. Builds on FusionFix (installed per the installation guide) and Wave 0’s lessons.

> *Installation:* Start with a fresh save on a clean GTA IV 1.0.8.0. Install FusionFix first, then mods in the order specified in the installation guide.

—

Graphics

FusionFix’s graphics feature set is this wave’s visual layer. It ships inside the framework — no separate ENB or shader pack is required for the baseline look.

FusionFix — Graphics

| Field | Value | |---|---| | *Version* | v5.0.1 | | *Dependencies* | Ultimate ASI Loader (bundled) | | *System Impact* | Visual quality, performance |

Provides the wave's graphical overhaul: ambient occlusion, tone mapping, restored console colour grading ("Console Gamma"), sun shafts, volumetric fog, FXAA/SMAA anti-aliasing, shadow filtering, an FPS limiter, and an optional Vulkan renderer (via DXVK).

No separate install — enable the options in the in-game FusionFix menu (see 06-fusionfix-config.md).

Various Fixes

| Field | Value | |---|---| | *Version* | latest (see GitHub releases) | | *Author* | valentyn-l | | *Dependencies* | FusionFix (Fusion Overloader) | | *System Impact* | Texture LODs, prop placement, shaders, console restoration |

Complements FusionFix with hundreds of visual fixes: broken texture LODs, misplaced props, wrong shaders/materials, missing shadows, and restored console content (shop signs, ads, beta textures). Installs via the Fusion Overloader update folder.

Start a new save after installing — the mod warns that an old save can show "flying buildings" if the map fixes conflict with prior state.

Higher Resolution Vehicle Pack

| Field | Value | |---|---| | *Version* | latest (LibertyCity) | | *Dependencies* | OpenIV (or FusionFix update folder) | | *System Impact* | HD vehicle textures |

Replaces the game's vehicle textures with higher-resolution versions. Version-agnostic (edits vehicles.img .wtd files), so it works on 1.0.8.0. Install via OpenIV or drop into FusionFix's update folder.

Note: raise VehicleBudget in GTAIV.EFLC.FusionFix.ini to avoid the "taxi bug" (cars spawning as low-quality taxis).

DayL's Natural Timecycle

| Field | Value | |---|---| | *Version* | latest (GTAall) | | *Dependencies* | None (no ENB needed) | | *System Impact* | Lighting, sky, weather colour |

A "vanilla-plus" timecycle that improves lighting, sunsets, and weather without an ENB/ReShade injector — stable and performance-friendly on 1.0.8.0. Install by copying its common/pc folders into the game root. An autumn-themed alternative ("Sweet Autumn") is also available.

User to provide — further visual overhaul

| Field | Value | |---|---| | *Version* | — | | *Dependencies* | FusionFix | | *System Impact* | Visual quality |

Slot for additional graphics mods not covered above.

> *Not for this 1.0.8.0 target:* RTX Remix (path tracing, by xoxor4d) and iCEnhancer 4.0 are Complete Edition / 1.0.4.0-specific and will not run on 1.0.8.0.

—

Content

Content mods (vehicles, weapons, map additions, new missions) run as scripts (via IV-SDK .NET) or as archive asset replacements (via OpenIV).

IV-SDK .NET

| Field | Value | |---|---| | *Version* | 1.9.1 | | *Author* | ItsClonkAndre | | *Dependencies* | FusionFix (ASI loading) | | *System Impact* | Enables .NET script mods (content & mechanics) |

The .NET scripting framework for GTA IV 1.0.7.0/1.0.8.0. Required to run .NET script mods (new missions, gameplay systems). Install per its documentation and place scripts in the game's scripts folder.

Installation notes: requires Visual C++ 2005 Redistributable (x86) and the DirectX June 2010 SDK — standard for downgraded GTA IV setups.

OpenIV

| Field | Value | |---|---| | *Version* | latest (openiv.com) | | *Dependencies* | None | | *System Impact* | Tool for installing vehicle/weapon asset mods |

The standard editor for GTA IV's .img/.wdr archives. Required to install any asset-based content mod (vehicles, weapons, textures). Install it once and use it to open and edit the game's archive files.

User to provide — content mod(s) for 1.0.8.0

| Field | Value | |---|---| | *Version* | — | | *Dependencies* | OpenIV (assets) or IV-SDK .NET (scripts) | | *System Impact* | New vehicles / weapons / missions in world |

Slot for content mods that run on 1.0.8.0. Note: many popular vehicle packs (e.g. "First Degree 154 Vehicle Addon Pack") are built for the Complete Edition only and will not drop into a 1.0.8.0 install — check each mod's stated patch target before adding.

—

Mechanics

Mechanics mods deepen combat, AI, and the danger of Liberty City. Potential Grim and Responsive Plus (same author) are designed to run together.

Potential Grim

| Field | Value | |---|---| | *Version* | latest (see thread) | | *Author* | iiCriminnaaL | | *Dependencies* | FusionFix, ASI loader (bundled) | | *System Impact* | Gang reputation, aggression, world danger |

A realism overhaul that makes Liberty City grittier: a gang reputation system that evolves with your actions, more aggressive NPCs, and spontaneous street gunfights. Built for patches 1.0.7.0 and 1.0.8.0.

Installation: download from the GTAForums thread and follow its current instructions (script files go in the game's scripts folder).

Responsive Plus

| Field | Value | |---|---| | *Version* | latest (see thread) | | *Author* | iiCriminnaaL | | *Dependencies* | FusionFix, ASI loader (bundled) | | *System Impact* | Weapon feel, combat balance, vehicle durability |

Companion to Potential Grim by the same author. Tightens weapon handling and recoil, rebalances combat, and adjusts vehicle durability. Designed to pair with Potential Grim — install both for the full effect.

User to provide — additional mechanics

| Field | Value | |---|---| | *Version* | — | | *Dependencies* | IV-SDK .NET | | *System Impact* | Damage model, police AI, economy |

Slot for further mechanics mods (e.g. police-response or economy systems) that run on IV-SDK .NET.

—

Audio

Radio Restoration (via GTA IV Downgrader)

| Field | Value | |---|---| | Version | v2.2 (Downgrader) | | Dependencies | None | | System Impact | Restores the original radio soundtrack |

The Complete Edition removed 50 songs in 2018 when licences expired. The Downgrader's *radio downgrade* option restores the original stations. Enable it during Step 2 of the installation guide.

User to provide — audio mod(s)

| Field | Value | |---|---| | Version | — | | Dependencies | FusionFix | | System Impact | Radio content, sound effects |

Slot for additional audio mods not covered by the radio restoration.

Wave 1: City of Dreams — Strategy Guide

> *The safehouse is bigger now. The calls come from different people — louder, more dangerous. You know which streets to avoid, which cops take bribes, which alleys dead-end. But the city has changed too. New faces. New threats. And the rules you learned? Some of them just got rewritten.*

—

Adjusting to Wave 1

Wave 1 assumes you understand the basics. Here's what's different:

- *Economy is tighter* — mods may increase costs and decrease mission payouts
- *Police are smarter* — longer search durations, better pursuit AI
- *Vehicles handle differently* — physics mods make driving more punishing
- *Combat is deadlier* — damage mods mean fewer shots to kill (both you and enemies)
- *New content* — vehicles, weapons, and map additions you need to learn

—

Advanced Strategy

Mission Planning

1. *Scout ahead* — drive to the mission area before triggering the objective
2. *Identify escape routes* — know where you're going before the shooting starts
3. *Prepare your vehicle* — a fast, durable car is worth more than a weapon
4. *Use the environment* — construction sites, alleys, and rooftops are tactical assets
5. *Save before every mission* — manual saves, not just autosaves

Vehicle Selection

| Type | Best For | Avoid For | |---|---|---| | Compact cars | City driving, tight alleys | Highway chases, ramming | | Sports cars | Speed, police evasion | Off-road, durability | | SUVs | Durability, ramming, off-road | Cornering, speed | | Motorcycles | Traffic weaving, off-road | Any collision | | Trucks | Roadblocks, intimidation | Everything else |

Weapon Loadouts

- *Primary slot* — Assault Rifle or SMG (mission flexibility)
- *Secondary slot* — Pistol (quick-draw, accurate)
- *Heavy slot* — Shotgun or Grenades (situational)
- *Melee* — Baseball bat or knife (silent, free ammo)

> *Pro tip*: Don't carry every weapon. You can't switch fast enough in a firefight. Pick 2-3 that cover your range needs.

Money Management

- *Don't buy cars* — they spawn in driveways and parking lots. Steal what you need.
- *Invest in the safehouse* — some mods add safehouse upgrades that provide benefits
- *Ammo is the real expense* — use melee and pistol for random encounters
- *Side missions matter* — vigilante, paramedic, and taxi work pay well

—

FusionFix Tweaks for Wave 1

Wave 1 enables FusionFix settings that are unnecessary (or too much) for Wave 0.

See 06-fusionfix-config.md for the full reference. Key changes:

| Setting | Recommended | Effect | |----|-----|----| | DisableClipTeleport | true | Prevents streaming crashes with heavy mods | | EnableAmbientPeds | true | Adds more pedestrians for immersion | | FixVehicleCollision | true | Required for vehicle damage mods | | IncreaseVehicleCount | 1.5-2.0 | More traffic, more chaos | | UnlockFrameRate | true | High FPS with graphics mods |

Refer to the [FusionFix Config] chapter for the full list and explanations.

—

Long-Term Strategy

1. *Complete all side content first* — missions get harder with mods
2. *Build relationships* — friend activities unlock special abilities and vehicles
3. *Explore every borough* — Wave 1 mods add content throughout the city
4. *Experiment with failures* — some mods add consequences to failure that change the story
5. *Take breaks* — modded GTA IV can be punishing. Step away when frustrated.

FusionFix Configuration Reference

> FusionFix adds a real-time options menu and reads its settings from a single .ini file. Most options are toggled in-game; the .ini is for advanced users.

—

In-game menu

Open *Settings* → *FusionFix* in the pause menu. Options are grouped as follows (verified against v5.0.1).

Display

| Option | Effect | |----|----| | FOV | Adjusts field of view. | | Language | Switches language in-game. | | Definition | Toggles the old console “fuzzy” look. | | Console Gamma | Restores the Xbox 360 colour curve (strongly recommended). | | Motion Blur | Toggle with several intensity levels. | | Depth of Field | Distant-blur intensity, separate from Definition. | | Bloom | Global bloom toggle. | | Screen Filter | Colour filters for the main game and episodes. | | Distant Lights | Integrated Project2DFX extended light draw distance. |

Graphics

| Option | Effect | |----|----| | FPS Limiter | Custom FPS cap (fixes physics/animation above 30 FPS). | | Anti-aliasing | FXAA or SMAA. | | Volumetric Fog | Advanced fog shader that hides world edges. | |

Sun Shafts | God rays faithful to the original art. | | *Tone Mapping* | Prevents blown-out highlights. | | *Ambient Occlusion* | Scalable AO for added depth. | | *Shadow Filter* | Sharp / soft / contact-hardening shadows. | | *Graphics API* | DirectX 9 or Vulkan (via DXVK); requires restart. |

Game

| Option | Effect | |---|---| | *Skip Intro / Skip Menu* | Skips intro logos / main menu. | | *Letterbox / Pillarbox* | Cutscene borders. | | *Transparent Map Menu* | See-through map screen. | | *FPS Counter* | On-screen counter. | | *Windowed / Borderless* | Window modes. | | *Pause On Focus Loss* | Auto-pauses when minimized. |

Controls

| Option | Effect | |---|---| | *Always Run* | Run by default. | | *Raw Input* | Bypasses Windows mouse acceleration. | | *Turn Indicators* | Vehicle indicators / hazard lights. | | *Instant Taxi Stop* | Skips the taxi-ride fade. | | *Gamepad Icons* | Xbox / PS / Switch / Steam Deck icon styles. | | *Mouse Look / Aim Sensitivity* | Separate look and aim sensitivity. |

Advanced: configuration file

Advanced options are read from *GTAIV.EFLC.FusionFix.ini* in the game root. The file is created on first launch; FusionFix also ships a reference copy in *data/plugins/*.

Examples of .ini-only options (v5.0.1):

| Key | Default | Effect | |---|---| | *EnablePreAlphaDepth* | 1 | Renders depth effects behind transparent objects. | | *ReflectionMSAAQuality* | 0 | MSAA on vehicle/water/mirror reflections (may vary by GPU/API). | | *ExtraDynamicShadows* | 0 | Extra dynamic-shadow coverage (2 = more objects). |

> On 1.0.8.0, install the *Legacy Addon* alongside the main FusionFix archive (see the installation guide). The addon ships the compatibility shims that let FusionFix run on the legacy build.
