1 Chapter 1: What is RimWorld

1.1 Learning Objectives

- Understand RimWorld's core game loop and how a colony grows from crash-landing to escape
- Choose the right storyteller, difficulty, and starting scenario for a first playthrough
- Evaluate colonists and pick a landing spot with good strategic properties
- Understand what each DLC adds and decide which to enable on a first run

1.2 The Core Game Loop

RimWorld is a colony survival simulator set on a distant planet. You start with a handful of survivors — called *pawns* — who have crash-landed with nothing but the clothes on their backs and a few scattered supplies. From there, the loop is simple:

Crash land → build shelter → gather food → survive threats → research better tech → expand your base → defend against bigger threats → build a spaceship and escape (or don't).

Each of your pawns has a unique backstory, personality traits, skills, and health conditions. They get hungry, tired, and moody. They fall in love, start fights, throw parties, and have mental breakdowns. Your job isn't to control them directly — you issue *orders* (build this wall, harvest those crops, attack that raider) and the pawns execute those orders based on their own priorities and personality.

RimWorld is **a story generator first, a strategy game second**. The AI storyteller adapts events to your colony's situation. Things will go wrong. Pawns will die in stupid, tragic, or heroic ways. That's not failure — it's the story. The game's loading screen even says it: *"RimWorld is a story generator, not a skill test. Losing is fun."*

Every colony is a unique narrative. Some colonies become peaceful farming communes. Others become cybernetic supersoldier factories. Some burn to the ground because a pyromaniac had a bad day. All of these are valid outcomes.

1.3 Choosing a Start Scenario

When you create a new game, you pick a starting scenario. Each gives you a different number of pawns and starting resources.

Scenario	Pawns	Resources	Difficulty	Recommendation
Crashlanded	3	Moderate (weapons, some steel, packaged meals, medicine)	Standard	Pick this for your first game
Rich Explorer	1	High (advanced weapon, gold, components)	Harder than it looks — one pawn doing everything	Try after your first colony
Naked Brutality	1	Nothing — literally naked, zero items	Very hard — one disease or bad fight ends it	Save for when you want a challenge

Crashlanded is the intended new-player experience. Three pawns let you cover all the essential skills (at least one good cook, one good builder, one good shooter) without being overwhelmed. Rich Explorer gives you one well-equipped pawn with good tech, but a single injury or mental break can spiral fast. Naked Brutality is RimWorld hard mode — you have nothing, you are nothing, and you will probably die to a squirrel.

1.4 Choosing a Storyteller

The storyteller is the AI that decides what happens in your colony — when raiders attack, when traders visit, when diseases strike, and when nothing happens at all. RimWorld has three core storytellers, each with a distinct personality.

Storyteller	Style	What to Expect
Cassandra Classic	Steady, predictable difficulty ramp	Events come at a consistent pace. As your colony grows wealthier, threats get bigger. She gives you time to recover between attacks.
Phoebe Chillax	Long peace, then sudden chaos	You'll go seasons with nothing happening — then a massive raid, a plague, and a solar flare all hit at once. The long quiet periods make the sudden disasters feel worse because you're not prepared.
Randy Random	Completely unpredictable	Anything can happen at any time, in any combination. Two raids back-to-back, followed by a cargo pod full of wooden feet, followed by nothing for a year. Entertaining, but not good for learning.

Recommendation: Cassandra Classic for your first colony. Her steady pacing teaches you the natural rhythm of RimWorld. You'll always be slightly behind where you need to be — that's by design — but you'll never feel blindsided. Save Randy for your third or fourth colony when you want chaos.

Choose **Strive to Survive** difficulty with Cassandra. It is labelled as the “intended RimWorld experience” and hits the sweet spot where you need to think about your decisions without feeling unfair.

1.5 Difficulty Settings

RimWorld offers a difficulty slider from **Peaceful** (no major threats) to **Losing is Fun** (the game actively tries to break you). Here's what each tier means in practice:

Difficulty	Threat Level	Who It's For
Peaceful	No raids or major hostiles	Tutorial only — you'll learn base-building but not survival
Community Builder	Light threats, generous mood bonuses	Relaxed playthroughs, storytelling without stress
Adventure Story	Moderate threats, small mood bonuses	A gentler introduction to combat
Strive to Survive	Serious threats, no bonuses	The intended experience — pick this
Blood and Dust	Heavy threats, mood penalties	For experienced players who want a fight
Losing is Fun	Maximum threats, harsh penalties	Self-explanatory — you will lose

You can also set a **custom difficulty** to tweak individual sliders — threat scale, colonist mood, crop yield, resource yield, and more. If Strive to Survive feels too punishing, drop it to Adventure Story rather than rage-quitting. You can change difficulty at any time from the options menu mid-game.

For a first colony, start on **Adventure Story** or **Strive to Survive** with Cassandra Classic. Adventure Story gives you more breathing room to learn; Strive to Survive teaches you good habits because mistakes have real consequences.

1.6 Colonist Selection Guide

Before you land, the game presents you with a pool of random colonists to choose from. You'll also see the option to **randomize** each slot — click it as many times as you like. Don't settle for terrible pawns just because they showed up first. A good starting team is the difference between a smooth first year and watching everyone starve by day 5.

1.6.1 Skills

Every pawn has 12 skills rated from 0-20, with higher being better. For your first colony, prioritize these skills in roughly this order:

1. **Plants** — Food is life. Someone needs to grow crops fast enough to feed everyone. Without a decent grower, you starve.
2. **Construction** — Walls, beds, workbenches, doors. If you can't build, you have no base.
3. **Cooking** — Raw food gives a mood penalty. Meals give mood bonuses. A good cook also reduces food poisoning risk.
4. **Shooting** — Raiders *will* come. Someone needs to hold a gun and hit what they aim at.
5. **Mining** — Steel and components come from mining. Without them, you can't build anything beyond wood.
6. **Medical** — Injuries happen. Infections kill untreated pawns. You need at least one pawn who can patch people up without making things worse.
7. **Social** — Trading prices, prisoner recruitment, and faction relations all depend on social skill.
8. **Intellectual** — Research unlocks electricity, better weapons, advanced medicine, and eventually the spaceship.
9. **Animals** — Taming and handling animals for hunting, hauling, and combat. Useful mid-game, not urgent early.
10. **Artistic** — Sculptures for beauty and mood. Important later, not early.
11. **Melee** — Useful for blocking doorways and hunting small game. Risky against armed raiders without good armor.
12. **Crafting** — Making weapons, armor, and components. Critical mid-game, not early.

You don't need every skill covered — **4-5 good colonists can cover the basics**. Look at your three Crashlanded pawns as a team: do they collectively have Plants, Construction, Cooking, Shooting, and Medical? If yes, you're in good shape.

1.6.2 Passions

Next to each skill in the colonist screen, you'll see zero, one, or two small flame icons. These represent **passion** — how much a pawn enjoys doing that work:

- **No flame**: The pawn does the task but gains XP very slowly.
- **One flame (interested)**: Gains XP at 100% speed. Solid.
- **Two flames (burning passion)**: Gains XP at 150% speed and gets a mood bonus while doing it. This is what you want.

A pawn with burning passion in Cooking will level up fast and stay happy while cooking. A pawn with no passion in Cooking will level slowly and might hate doing it. Prioritise passions over raw

skill numbers — a level 3 grower with burning passion will surpass a level 6 grower with no passion within a season.

1.6.3 Traits to Look For

Every pawn has 1-3 personality traits. Some are great, some are dealbreakers.

Good traits: - **Industrious** (+20% work speed) — they simply get more done, every single day. - **Fast Learner** (+50% XP gain) — they level up fast in everything. - **Jogger** (+20% move speed) — reaches fires, wounded pawns, and battle positions faster. Movement speed saves lives. - **Tough** (takes half damage) — the single best combat trait in the game. A tough pawn can tank hits that would kill anyone else. - **Iron-willed** (mental break threshold is very high) — they stay calm when everything is on fire. - **Sanguine** (permanent +12 mood bonus) — happy pawns don't have mental breaks. - **Kind** (won't insult others, gets mood from being kind) — reduces social fights, improves colony mood.

Dealbreaker traits — do NOT take these pawns on your first colony: - **Pyromaniac** — Will randomly start fires in your base during mental breaks. A wooden base + pyromaniac = colony-ending disaster. - **Gourmand** — Eats twice as much food and binges during food shortages. In a first colony that's already struggling with food, this is a death sentence. - **Wimp** — Incapacitated by minor pain. Falls over from a bruise. Useless in any fight and can't rescue others. - **Chemical Interest / Chemical Fascination** — Will randomly take drugs, get addicted, and go on binges. Addiction management is not a first-colony problem. - **Depressive / Pessimist / Volatile** — Permanent or frequent mood penalties. Mental breaks cascade into disasters for new players.

1.6.4 Age and Health

Avoid pawns over 60 unless their skills are spectacular. Old pawns develop age-related conditions — bad back (slower movement), cataracts (worse shooting), dementia (random confusion), and frail torso (vulnerable to one-shot kills). They can also develop these conditions mid-game, which you won't be equipped to handle early.

Check the **Health** tab on each pawn before finalising. Red flags: addiction (any kind), permanent injuries, carcinoma (cancer), or a missing limb. These can all be fixed eventually with bionic replacements, but not in the first year.

For your first colony, aim for **three pawns aged 20-50, with collective coverage of Plants/Construction/Cooking/Shooting/Medical, no dealbreaker traits, and at least some passion icons in their key skills.**

1.7 Biome Comparison Guide

The biome determines the climate, available plants/wildlife, diseases, and challenges of your map. Some biomes are forgiving. Others will kill you before you finish building your first room. Here is how they compare:

Biome	Difficulty	Growing Season	Wood	Unique Challenge
Temperate Forest	Easy	50-60 days/year	Abundant	None — best for first game
Boreal Forest	Medium	30-40 days/year	Moderate	Cold winters, short growing season
Arid Shrubland	Medium	40-50 days/year	Scarce	Heat waves, sparse wood, fewer animals

Biome	Difficulty	Growing Season	Wood	Unique Challenge
Tropical Rainforest	Medium	Year-round 60/60	Abundant	Constant diseases (malaria, sleeping sickness), aggressive predators
Desert	Hard	20-30 days/year	Very scarce	Extreme heat, almost no wood, few animals
Tundra	Hard	10-20 days/year	Scarce	Extreme cold, short growing, few animals
Extreme Desert	Very Hard	0-10 days/year	None	Heat, no wood, no soil, almost nothing lives here
Ice Sheet	Extreme	0 days/year	None	Perpetual -40°C or worse. No plants. No animals. Cannibalism or death.
Sea Ice	Impossible	0 days/year	None	There is nothing. Literally nothing. You will die.

Recommendation: Temperate Forest, on a tile with year-round growing (look for the “Growing Period: Year-round” label on the world map). This gives you the most forgiving setup: abundant wood, plenty of animals to hunt, mild temperatures, and a long growing season so your crops won’t die to an early frost.

If you want slightly more challenge without being punishing, Boreal Forest is a good second choice — you’ll need to stockpile food for winter and build heaters, but it’s manageable.

1.8 Choosing a Landing Tile

The world map is divided into hexagonal tiles. When you select a starting tile and click it, you’ll see detailed information about what’s there. Here are the features that matter most on your first colony:

- **Geothermal vents:** These are geysers of steam that let you build Geothermal Generators later in the game. Each one produces 3600W of free, infinite power — no fuel, no sun, no batteries needed. Look for tiles with **at least 2 vents**. Mark them during base planning — you’ll want to build your power grid near them.
- **Fertile soil:** Darker patches of ground where crops grow at 140% speed. This is a massive advantage for your food supply. A 5×5 field on fertile soil produces nearly as much as a 7×7 field on normal soil. You want at least some fertile soil inside your planned base area.
- **Road access:** Tiles connected to roads make caravan travel faster. If you’re near a road, traders visit more often and your own caravans move quicker. Ancient asphalt roads are the best; dirt roads are still helpful.
- **Mountains:** Building into a mountain gives you natural walls that raiders can’t break through. The downside: mountain bases risk **infestations** (giant insects bursting out of your walls) in the mid-to-late game. A tile with *some* mountain but plenty of open space gives you the best of both worlds.
- **Rivers:** A natural defensive barrier. Raiders move slower crossing water, giving your shooters more time to pick them off. Rivers can also power Watermill Generators for early-game electricity.
- **Proximity to settlements:** Neutral or friendly faction settlements within a few tiles mean nearby trading partners. You can send caravans to buy and sell goods without traveling across the entire world.

Recommendation: Find a Temperate Forest tile with year-round growing, at least **2 geothermal vents**, some **fertile soil**, and near a **road**. Don't overthink it — you can launch the ship from almost any tile. The important thing is to start playing.

1.9 Early Game (Days 1-15)

Your first two weeks set the trajectory for your entire colony. Here's the priority order:

Hour 1 — Shelter and sleeping spots. Pause the game immediately (Space bar). Find a defensible area near fertile soil and your geothermal vents. Build a single room — wood walls, wood door, wood roof — large enough for three sleeping spots. Use the Architect menu to designate beds or sleeping spots. A tiny wood shack is ugly but it keeps pawns from sleeping outside (which gives a massive mood penalty). Remove the “No Roof” zone from the area so it auto-builds a roof. In the meantime, your three survivors are standing around outside — get that room built first.

Day 1-2 — Food starts growing. Designate a growing zone (Architect → Zone → Growing Zone) on fertile soil. Plant **rice** — it is the fastest-growing crop (roughly 3 days to harvest) and will get food on the table before your starting packaged meals run out. Rice gives less yield per harvest than corn or potatoes, but it grows fast enough to prevent starvation while you get established. Plant potatoes on less fertile soil nearby. Set a stockpile zone for food and one for other items.

Day 2-5 — A real base emerges. Expand from the starter shack into separate rooms: one for sleeping, one for a kitchen/butcher table, one for a freezer (more on this below), and one for general storage. Build walls, floors, and doors. Build a horseshoe pin for recreation (pawns get miserable without it). Build a campfire or, if you've researched it, a wood-fired generator plus a cooler to create a walk-in freezer — this is what stops your food from rotting.

The freezer is the most important room in your base. Without it, meat rots in 2-3 days and meals rot in 3-4 days. A freezer is a room with double-thick walls, a cooler set to below 0°C, and an airlock (door → empty tile → door) to keep cold air in. Power it with a wood-fired generator or a couple of solar panels.

Day 3-7 — Research begins. Build a Research Bench. Set a pawn with good Intellectual skill to prioritise research. Your research order should be: **Batteries** (store power for night-time and eclipses) → **Solar Panels** (reliable daytime power) → **Stonecutting** (replace those wooden walls before they burn). You can also rush **Microelectronics** for the Comms Console and trade beacons, but that's a mid-game goal.

Day 5-10 — First raid. They're coming. Raiders scale based on your colony's wealth, so early raids are small — usually a single attacker with a knife or a poor-quality gun. Draft your pawns (select them and press R), position them behind walls or trees for cover, and shoot the raider before they reach melee range. If you have a pawn with decent Melee skill, hide them behind a door and ambush the raider as they walk through. After the fight, strip the raider's corpse for their weapon and any clothing — free gear.

Day 7-15 — Fireproofing and growing. Once you research Stonecutting, build a Stonecutter's Table and start making stone blocks. Replace your wooden walls with stone (any type — sandstone is fastest to cut, granite is strongest). A single fire in a wooden base spreads to every connected wooden wall and can destroy your entire base in minutes. Stone walls don't burn.

By day 15, you should have a small multi-room base, a functioning freezer, crops growing, basic research underway, and everyone armed with at least a poor-quality weapon. You should also have accepted your first refugee or rescue quest — an extra colonist is a huge boost this early.

1.9.1 Common Early-Game Mistakes

- **Building too big, too fast.** A massive base spreads your resources thin, takes forever to build, and is hard to defend. Start small, expand outward as you need rooms.

- **No freezer.** Meat spoils in 2 days. Meals spoil in 3. You will lose half your food to rot before you can eat it. Freezer first, always.
- **Wooden walls everywhere.** One lightning strike, one pyromaniac, one Zzztt event, and your base is gone. Stone walls = fire immune.
- **No recreation.** Pawns with no recreation get a “Recreation-starved” mood penalty that escalates quickly. Build a horseshoe pin on day one — it costs almost nothing.
- **Ignoring mood.** Look at the Mood tab on each pawn. If someone’s below 30%, they risk a mental break. Fix the problem — better food, nicer room, recreation, or more sleep.

1.10 Mid Game (Days 15-100)

By the mid game, your base should be self-sufficient: food is stable, you have a few extra colonists (aim for 6-10), and you’re starting to think about long-term survival rather than just getting through the next day.

Stable power grid. Solar panels + batteries are good but vulnerable to eclipses (no sun for days = dead batteries). Add a Geothermal Generator to each vent on your map. One geothermal vent produces 3600W forever — enough to run your entire base with no fuel and no downtime. Connect everything with power conduits. Add a few backup wood-fired generators for emergencies.

Defences. Raiders are getting bigger. A single wall and a couple of shooters won’t cut it any more. Build a **killbox** — a funnel-shaped entrance to your base that forces raiders into a narrow corridor where your shooters can concentrate fire on them from behind cover. Position colonists behind sandbags or barricades at the end of the funnel. Add traps — steel deadfall traps in a checkerboard pattern will cripple or kill raiders before they reach your firing line. Build walls around your base perimeter so raiders can’t walk in from any direction.

Prisoner recruitment. Capture downed raiders instead of killing them. Build a prison room (separate room with a bed, set it as a Prisoner Bed). Wardens (pawns with high Social) can attempt to recruit prisoners over time. A recruited raider joins your colony and brings their skills with them — this is your primary source of new colonists. Build individual cells rather than barracks: prisoners in barracks will constantly fight each other or attempt break-outs, while a private cell keeps them calm (and makes it easier to convert them if using Ideology).

Research priorities. After the survival basics, push toward: **Microelectronics** (Comms Console lets you call trade ships, Orbital Trade Beacon lets you sell items directly from your base) → **Fabrication** (craft components and advanced weapons yourself instead of relying on traders) → **Geothermal Power** (already mentioned).

Trading. Build an Orbital Trade Beacon over your main stockpile. This lets passing trade ships beam goods up in exchange for silver. If you’re near friendly settlements, send a caravan (two pawns, some pack animals, and your surplus goods) to trade in person. Sell excess food, crafted clothing, sculptures, or captured weapons. Buy components, advanced medicine, and psychic lances.

Key milestones: - Surviving a **siege** (raiders set up mortars outside your base and shell you from a distance). Counter with your own mortars, or sally out with your shooters to destroy the sieging party. - Building your first **multi-analyzer** to unlock advanced research. - Outfitting all combat colonists in flak vests and helmets — this is the baseline protection everyone needs. - Creating a dedicated hospital room with hospital beds, a vital monitor, and a stockpile of medicine.

1.11 Late Game (Days 100+)

Your colony is now established, wealthy, and well-defended. You have 10-15 colonists, advanced technology, and the resources to pursue one of the game’s win conditions — or simply keep building forever.

1.11.1 Win Conditions

RimWorld offers several ways to “beat” the game, but none are required. Many players build colonies that run for decades with no intention of ever leaving.

Ship to the Stars (base game). Research the entire shipbuilding technology tree, construct a spaceship from advanced components, and defend it through a 15-day reactor startup sequence. During those 15 days, the AI storyteller throws everything it has at you — escalating raids, mechanoid assaults, and sieges. If your ship survives and you put all your colonists aboard, you win. This is the classic RimWorld ending.

Royal Ascent (Royalty DLC). Gain favour with the shattered Empire faction by completing quests and hosting nobles. Raise a colonist to the rank of Count or Countess, then call a shuttle from the Empire to take you off-world. Along the way, your noble colonist gains psycasts — psychic powers that let you stun enemies, teleport allies, or call down lightning — but also demands increasingly luxurious bedroom and throne room requirements.

Archonexus (Ideology DLC). Sell your colony to an allied faction and restart with a portion of your wealth, research, and a few chosen colonists. Do this three times, each restart harder than the last, and you reach the Archonexus — a transcendent AI entity. This is the narrative deep-end, best attempted after you’ve played through the other endings.

No ending. Many players — perhaps most — never “win.” They build a thriving colony and enjoy the ongoing story of raids, weddings, disasters, and recovery. When the colony feels complete, they start a new one with different mods, a different biome, and a different story. This is a completely valid way to play.

1.11.2 Late-Game Milestones

- Defeating a **mechanoid cluster** (a self-contained base of killer robots that lands on your map with turrets, assemblers, and a shield).
- Surviving a **manhunter pack** (50+ enraged animals swarm your base — you either kill them all or hide indoors for days).
- Equipping front-line colonists with marine or recon armour.
- Installing bionic limbs and organs on injured pawns — lost an arm to a scyther? Replace it with a bionic arm that’s actually better than the original.
- Building a second colony on another tile — only recommended once your main base is fully automated and self-sufficient.

1.12 DLC Breakdown

RimWorld has five expansion packs. Each adds layers of complexity, and you can enable or disable them per save file. Here’s what each one does and when you should consider adding it:

Royalty. Adds the Empire faction (a shattered interstellar monarchy), psycasts (magic-like psychic powers), nobility titles, and a quest system with honour rewards. Royalty integrates cleanly with the base game — it doesn’t fundamentally change how you play, but adds new tools and a new faction.

When to add: After your first playthrough, or enable it from the start if you want faction variety and psycasts.

Ideology. Adds belief systems, rituals, roles (leader, moral guide), and memes (core beliefs). Every colonist follows an ideology that dictates what they find acceptable — some ideologies demand cannibalism, blind reverence for darkness, or tree worship. This completely reshapes every decision you make. Huge depth, significantly more complex. **When to add:** After you’re comfortable with the base game. Ideology is excellent but overwhelming if you’re still learning how freezers work.

Biotech. Adds children (colonists can have babies), mechanitors (controlling your own mechanoids), and xenogenes (genetic engineering — create custom humanoid races). This is the most integrated

and beloved DLC. The mechanics slot naturally into the base game and enrich every stage of play. **When to add:** Fine to enable on your first run. Biotech's additions appear organically and you can engage with them when you're ready.

Anomaly. Horror-themed expansion. Adds void monsters, monolith events, flesh beasts, and reality-warping threats. Your colonists can be captured, mutated, or driven insane by entities from beyond. Much more dangerous than the base game. **When to add:** Wait until you've defended against regular raids, mech clusters, and sieges. Anomaly's threats are designed to challenge experienced players.

Odyssey. A narrative-focused expansion with new factions, quest chains, and territory mechanics. Adds fishing and ocean-based content. **When to add:** Fine to enable from the start — it enriches world generation and adds variety without dramatically increasing difficulty.

Recommendation for your first run: Enable **Biotech** and **Odyssey**. Add **Royalty** if you want psycasts. Save **Ideology** and **Anomaly** for a second or third playthrough when you're ready for more complexity.

1.13 What is Modding?

Modding means modifying the game with community-created content. RimWorld has one of the most active modding communities in gaming — tens of thousands of mods add everything from bugfixes to entire new game systems.

Here's what you need to know before you start:

- **Mods come from the Steam Workshop.** You subscribe to them on Steam, they download automatically, and RimPy (from Chapter 2) handles activating and sorting them. No manual file downloads, no zip extraction.
- **Load order matters.** Mods load from top to bottom when the game starts. If two mods change the same thing (say, how crafting menus look), the lower one wins. This is called "load order" and getting it wrong causes bugs or crashes. RimPy auto-sorts your load order correctly — you don't need to understand the details.
- **Frameworks come first.** Some mods are "libraries" — they provide tools that other mods use, but don't change the game themselves. The two essential ones are **Harmony** (a code-patching library) and **HugsLib** (a shared toolkit for mod authors). These must load before any mod that depends on them. RimPy handles this automatically.
- **You can create mod profiles.** RimPy lets you save different mod sets as "profiles." You can have a profile for this guide's modlist, another for a vanilla-like experience, and another for a challenge run. Switching profiles takes one click.
- **Some mods can't be removed mid-game.** Check each mod's Workshop page for compatibility notes. If it says "NOT safe to remove mid-save," removing it will corrupt your save file. When in doubt, start a new colony if you want to change your mod set.
- **RimWorld mods mostly play well together.** Unlike games like Skyrim where mod conflicts are constant, RimWorld's architecture makes mod conflicts relatively rare. The curated list in this guide has been verified for compatibility.

1.14 Next Steps

Proceed to [Chapter 2: Setup](#).

2 Chapter 2: Setup

2.1 Learning Objectives

- Install RimWorld and verify all DLC are active
- Install and configure RimPy Mod Manager
- Navigate the Steam Workshop to find and subscribe to mods
- Understand load order and how RimPy auto-sort works
- Set up mod profiles for different playthroughs

2.2 Installing RimWorld

RimWorld is available exclusively through Steam on Windows. If you haven't installed it yet:

1. Open Steam and search for "RimWorld" in the store.
2. Purchase the base game.
3. Install it through Steam (default location: C:\Program Files (x86)\Steam\steamapps\common\RimWorld).
4. Purchase and install the DLCs — Royalty, Ideology, Biotech, Anomaly, and Odyssey. You can install them all at once; you'll choose which to activate per save file.

Before doing anything with mods, launch RimWorld **once in vanilla** (no mods) to verify everything works. From the main menu: 1. Click **New Colony**. 2. The scenario selector will appear — you'll see all your owned DLCs listed as available. 3. Start the tutorial scenario if you've never played before. Or just create any colony to verify the game runs smoothly. 4. Exit the game.

This first launch creates RimWorld's configuration folders, which is what RimPy needs to detect your installation. If you skip this step, RimPy won't be able to find the game.

2.3 Installing RimPy

RimPy Mod Manager is a community-built tool that replaces RimWorld's built-in mod manager. It does three things the built-in manager cannot: 1. **Auto-sort** your mod load order correctly with one click. 2. **Warn you** about missing dependencies and known conflicts before you launch the game. 3. **Download mods** from Steam Workshop without needing to launch the game first.

2.3.1 Installation Steps

1. **Download RimPy.** Go to the [RimPy releases page](#). Download the latest release — look for the .exe installer or the portable .zip file for Windows. As of this writing, the latest version is RimPy Mod Manager 1.1.x.
2. **Run the installer.** If you downloaded the .exe, double-click to install. If you downloaded the portable .zip, extract it to a folder like C:\RimPy or your Documents folder. RimPy works from any location.
3. **First launch.** Open RimPy. It may take a moment to scan your Steam library. If it can't find RimWorld automatically, point it to your RimWorld install folder manually through the Settings menu.
4. **Steam integration.** RimPy needs to communicate with Steam to download mods. If you're logged into Steam on the same machine, this should work automatically. If RimPy shows a Steam connection error, restart Steam and try again.

2.3.2 What You'll See

When RimPy opens, you'll see: - A list of your subscribed mods on the left. - Your active mod list (the "load order") on the right. - Buttons at the top for sorting, saving, and managing profiles. - Colour-coded dependency warnings if anything is missing.

The interface looks busy on first glance, but you'll mostly use three buttons: **Sort**, **Save**, and **Run**. Everything else is information.

2.4 Navigating the Steam Workshop

All RimWorld mods are hosted on the [Steam Workshop](#). Here's how to find and subscribe to the ones in this guide:

1. **Open a mod's Workshop page.** Each mod entry in the following chapters includes a clickable name that links to its Workshop URL. The URLs follow the pattern `https://steamcommunity.com/sharedfiles/filedetails/?id=<WORKSHOP_ID>`.
2. **Read the description.** Before subscribing, scroll through the mod's description. Look for:
 - **Required items** — other mods or DLC that must be installed for this mod to work. A mod might say "Requires: Royalty DLC" or "Requires: HugsLib." RimPy also warns you about missing dependencies, but it's good to know before subscribing.
 - **Known incompatibilities** — mods that this one conflicts with. The curated list in this guide avoids known conflicts, but always check if you're adding mods outside the list.
 - **Version compatibility** — every mod in this guide has been verified for RimWorld 1.6. If a mod's Workshop page doesn't mention 1.6, skip it.
3. **Click Subscribe.** The green "Subscribe" button on the Workshop page adds the mod to your Steam library. Steam downloads it automatically in the background. You can see download progress in the Steam client's Downloads page.
4. **Wait for the download.** Some mods are a few kilobytes; others are hundreds of megabytes (especially graphics and sound mods). Give large mods a minute to finish downloading before launching RimPy.
5. **Refresh RimPy.** After subscribing, click the refresh button in RimPy (or restart it) and the new mod appears in your library.

2.4.1 Collections

Some mod authors create **Workshop Collections** — curated lists of mods that work together. If you see a collection linked from a mod's page, it's worth browsing, but don't blindly subscribe to everything in it. The modlist in this guide is more carefully curated for a beginner's first modded run.

2.4.2 Scanning for Updates

Steam keeps mods up to date automatically. However, some mods receive updates that change how they work or add new requirements. RimPy will flag mods whose Workshop version doesn't match your local version. If an update breaks your save, RimPy can roll back mods to earlier versions using its backup system.

2.5 Understanding Load Order

When RimWorld starts, it loads mods in a specific sequence from top to bottom. This sequence — the **load order** — is the single most important thing to get right. An incorrect load order causes crashes, broken features, and corrupted saves.

Here's how it works:

- **Mods that define the rules load first.** Harmony (code patching) and HugsLib (shared library) must always be at the very top of your load order. Every mod that uses them expects them to be loaded already. If Harmony isn't first, half your modlist won't work.
- **Frameworks and libraries load next.** Mods like JecsTools, ResearchPal, and Eccentric Tech - Core provide tools that other mods use. They must load before the mods that depend on them.
- **Content mods load last.** Anything that adds items, factions, animals, weapons, or quests. These use the frameworks from above to add their content.
- **Later mods override earlier ones.** If Mod A adds a crafting recipe for a steel sword, and Mod B also adds a recipe for a steel sword, the one from Mod B wins because it loads later. This is called

“patching” and is the primary way mods interact — one mod tweaks another’s behaviour by loading after it.

This sounds complicated, and it is. **That is why RimPy exists.** RimPy reads every mod’s metadata (its dependencies, what it patches, what it conflicts with) and calculates the correct load order automatically. You click one button. It sorts hundreds of mods in seconds. You never need to manually drag mods into position.

If you ever see advice about “just drag Harmony to the top,” ignore it — that’s advice for people not using RimPy. With RimPy, the auto-sort handles everything, including edge cases you’d never think of on your own.

2.6 Setting Up RimPy

Now that you understand what RimPy does, let’s configure it properly.

2.6.1 Step 1: Verify Your Mod List

Open RimPy. The left panel shows all mods you’ve subscribed to. The right panel shows your active load order. For a fresh install:

1. Click **Tools** → **Refresh Mods** (or the refresh icon) to ensure RimPy has the latest list.
2. In the left panel, verify that Harmony and HugsLib appear (if you’ve subscribed to them yet — if not, they’re covered in Chapter 3).
3. Ignore the right panel for now — it’s empty because you haven’t activated anything yet.

2.6.2 Step 2: Create a Profile

Profiles let you switch between different mod sets without manually activating and deactivating mods. This is useful for having a separate profile for this guide’s modlist versus a vanilla profile for testing.

1. Click the **Profiles** dropdown near the top of RimPy.
2. Select **New Profile**.
3. Name it “Home Among the Stars” or any name you prefer.
4. Click **OK**.

You now have an isolated profile. All mod activations and sorting in this profile won’t affect any other profiles. You can create additional profiles later — for example, a “Vanilla” profile with no mods for when you want the pure RimWorld experience.

2.6.3 Step 3: The Sort Button

The **Sort** button (or Ctrl+S) is RimPy’s core feature. It scans every activated mod, determines the correct load order, and rearranges them:

1. Activate a few mods by double-clicking them in the left panel (they move to the right panel). Or activate all mods in your current profile.
2. Click **Sort**.
3. RimPy displays a green checkmark if the sort succeeds, or a red warning with a description of what went wrong (missing dependency, version conflict, etc.).

Read the warnings. RimPy’s error messages are specific and actionable — it will tell you exactly which mod is missing a dependency and what that dependency is.

2.6.4 Step 4: Save and Run

After sorting: 1. Click **Save** (or Ctrl+S again) to save the current load order to your profile. 2. Click **Run** to launch RimWorld with this load order.

RimWorld will start up. You'll see the main menu with a "Mods" button. Click it to verify your mod list — it should match what you set up in RimPy. If a mod is missing, go back to RimPy, refresh, and check that you're subscribed.

2.6.5 RimPy Quick Reference

Action	How
Sort load order	Click Sort button (or Ctrl+S)
Save profile	Click Save
Launch game	Click Run
Refresh mod list	Click Refresh (circular arrow icon)
Activate/deactivate a mod	Double-click it
Search mods	Type in the search bar above the left panel
Check for updates	RimPy shows an orange update icon on outdated mods
Reorder manually	Drag mods in the right panel (but auto-sort is better)

2.7 Your First Mod Install

Let's walk through installing one mod from start to finish. We'll use **Harmony** as the example because nearly every mod in this guide depends on it.

2.7.1 Step 1: Subscribe on Steam Workshop

1. Open the [Harmony Workshop page](#) in your browser.
2. Click the green **Subscribe** button.
3. Steam will download Harmony in the background. The download is tiny (under 1 MB) — it should complete almost immediately.
4. Verify in the Steam client's **Downloads** page that the download finished.

2.7.2 Step 2: Activate in RimPy

1. Open (or switch to) RimPy.
2. Click **Refresh** if Harmony doesn't appear in your mod list.
3. Double-click **Harmony** in the left panel. It moves to the right panel — it's now active on your current profile.
4. Click **Sort**. Since it's the only mod active, the sort is trivial.
5. Click **Save**.

2.7.3 Step 3: Launch and Verify

1. Click **Run** in RimPy to launch RimWorld.
2. At the main menu, click the **Mods** button. You should see Harmony listed and active.
3. If it's marked with a green checkmark or no error indicator, it's loaded correctly.
4. Start a new colony and look at the debug log (Ctrl+` to open the console). You should see Harmony's startup message confirming it initialised. If there are any red error lines, note them and check the troubleshooting section in Chapter 14.
5. Exit RimWorld.

That's the complete install flow for one mod. Every mod in subsequent chapters follows the same pattern: **Subscribe** → **Refresh in RimPy** → **Activate** → **Sort** → **Save** → **Run**. You'll get fast at it.

Repeat this process for HugsLib (Workshop ID 818773962) as a second exercise. Harmony + HugsLib are the “always installed” pair — they form the foundation everything else builds on.

2.7.4 Before Moving On

At this point you should have: - RimWorld installed and launched once in vanilla mode. - RimPy Mod Manager installed and able to see your mods and launch RimWorld. - Harmony installed and verified as working. - A basic understanding of the Workshop → RimPy → Sort → Launch pipeline.

Don't worry about subscribing to every mod yet — each chapter will introduce mods as you read, and you'll install them one group at a time. The goal is to build your modlist progressively, understanding what each mod adds before installing the next one.

2.8 Next Steps

Proceed to [Chapter 3: Framework](#).

3 Chapter 3: Framework Mods

3.1 Learning Objectives

- Install the core libraries that almost every mod depends on
- Understand what each framework does
- Verify they load correctly

3.2 Overview

3.3 The Mods

3.3.1 XML Extensions

- **What it does:** Provides XML patching utilities that let other mods modify game data cleanly without overwriting files. Enables mods to add new texture color variants, floor types, and other data-driven content.
- **Why it's here:** Several graphical and content mods (including CCP's Stone Tweaks Vanilla) now require XML Extensions as of RimWorld 1.6. Its patching system is the modern replacement for older XML-based framework approaches.
- **Not OP because:** It's a pure framework — no gameplay content, no balance impact. It simply enables other mods to work.
- **Install:** OK to install now. Safe to add mid-save.

3.3.2 Eccentric Tech - Core

- **What it does:** Adds an advanced AI mainframe (Aurora Core), nanofabrication facilities, and Second Wave materials (Nanoweave, HD Hex Cells). Unlocks the entire Eccentric Tech research tree.
- **Why it's here:** Required dependency for Eccentric Tech - Advanced Shields. Also enables optional upgrades for Fusion Power and other Eccentric mods. The Aurora Core gives the research bench a personality — Aurora, a starship AI — which adds lore flavour without gameplay impact.
- **Not OP because:** The nanofabrication chain requires significant research investment and advanced resources. The Aurora Core must be built and connected to a Hi-Tech Research Bench, consuming space and components.
- **Install:** OK to install now. Safe to add mid-save.

3.4 Installation Checkpoint

- ✓ OK to install all mods in this chapter now. They are safe to add mid-save.

3.5 Next Steps

Proceed to [Chapter 4: Bugfixes & Performance](#).

4 Chapter 4: Bugfixes & Performance

4.1 Learning Objectives

- Fix known vanilla bugs that can ruin a colony
- Optimize game performance for smooth 4K gameplay
- Understand what impacts TPS (ticks per second)

4.2 Overview

4.3 The Mods

4.4 Installation Checkpoint

 OK to install all mods in this chapter now.

4.5 Next Steps

Proceed to [Chapter 5: UI / HUD](#).

5 Chapter 5: UI / HUD

5.1 Learning Objectives

- Improve RimWorld's interface for comfortable 4K use
- Reduce unnecessary clicks with smarter menus and tooltips
- Get better visibility into colony status

5.2 Overview

5.3 The Mods

5.3.1 Camera+

- **What it does:** Extends zoom range (both in and out), smooths camera movement and edge scrolling, adds far-zoom labels, marker dots/silhouettes, and keyboard shortcuts for saving/loading camera positions.
- **Why it's here:** Vanilla RimWorld's zoom range is restrictive — you can't see the whole map at once or zoom in close enough to appreciate pawn details. At 4K, being able to zoom out for battlefield overview and zoom in for inspection is essential. The dot/silhouette system also makes pawns visible at max zoom.
- **Not OP because:** Pure camera control. No gameplay changes, no balance impact. You see the same things, just from better distances.
- **Install:** OK to install now. Safe to add mid-save.

5.3.2 BetterInfoCard

- **What it does:** Expands the vanilla info card (the panel that opens when you click the "i" button) — makes it resizable, collapsible, and keep multiple info cards open at once. Adds stat comparison, stat favorites, and a hotkey toggle. Opening an info card no longer pauses the game.
- **Why it's here:** The vanilla info card is tiny, pauses the game unnecessarily, and only shows one at a time. If you want to compare two weapons or items, you have to memorise the first card's stats before opening the second. BetterInfoCard fixes all of this.
- **Not OP because:** It's purely a UI improvement — it surfaces information that's already in the game. No gameplay changes.
- **Install:** OK to install now. Safe to add mid-save.

5.3.3 Damage Indicators [1.6]

- **What it does:** Displays floating damage numbers above pawns, animals, and enemies when they take damage. Configurable — you can filter to only show damage from pawns (hiding natural decay/fire damage).
- **Why it's here:** Vanilla gives you no feedback on how much damage your attacks are doing. Floating numbers help you evaluate weapons, compare damage output, and understand combat outcomes without digging through the log. Especially useful for a new player learning which weapons are effective.
- **Not OP because:** Pure visual feedback — it doesn't change damage values, hit chances, or any combat mechanic. What you see is what was always happening.
- **Install:** OK to install now. Safe to add mid-save. Disable the "show all damage" setting in large raids if you notice lag.

5.3.4 Allow Tool

- **What it does:** Adds a suite of selection and order tools — Allow All, Haul Urgently, Finish Off, Force Harvest, Select Similar, and more. Accessed through new toolbar buttons and right-click menus.

- **Why it's here:** Vanilla RimWorld requires you to click each item individually to unforbid it after a battle, or manually mark each plant for harvest. Allow Tool turns multi-click chores into single-click operations, saving hundreds of clicks per session.
- **Not OP because:** It only automates *existing* actions you could already do manually — it doesn't make anything faster, cheaper, or stronger. The pawns still need to walk over and do the work.
- **Install:** OK to install now. Safe to add mid-save. Requires HugsLib (already in your load order from Chapter 3).

5.4 Installation Checkpoint

 OK to install all mods in this chapter now.

5.5 Next Steps

Proceed to [Chapter 6: Graphics](#).

6 Chapter 6: Graphics

6.1 Learning Objectives

- Improve visual clarity at 4K resolution
- Enhance RimWorld's aesthetics without changing gameplay
- Keep good performance while improving visuals

6.2 Overview

6.3 The Mods

6.3.1 CCP's Stone Tweaks Vanilla

- **What it does:** Applies colour tweaks to all vanilla stone types (sandstone, granite, limestone, slate, marble) so they look more distinct and natural. Includes built-in patches for Vanilla Royalty, Vanilla Ideology, Expanded Floors, and more. Colours are fully customisable via the mod settings menu.
- **Why it's here:** Vanilla stone types all blend into a muddy grey-brown at 4K resolution. Distinct colours make stone floors, walls, and sculptures visually readable — you can immediately tell granite from marble at a glance.
- **Not OP because:** Purely cosmetic. Nothing changes balance, game mechanics, or resource values. The mod only touches textures and colours.
- **Install:** OK to install now. Safe to add mid-save. Requires XML Extensions (already in your load order from Chapter 3).

6.3.2 Floor-Mounted Aquarium

- **What it does:** Adds floor-mounted aquariums in 3 sizes that emit light, increase room beauty, and periodically produce fish. Powered buildings that function as both decoration and a passive food source. Works with either Vanilla Fishing Expanded or Odyssey DLC's fishing mechanics.
- **Why it's here:** Bases look sterile without decorative touches. Aquariums add visual warmth to rec rooms, dining halls, and hospitals. The passive fish production is a small bonus, not the main draw — they're a beauty-building joy item first.
- **Not OP because:** Aquariums require power, resources to build, and space. Fish production is slow and minor — it won't replace hunting or farming. They're purely cosmetic with a negligible food side-effect. The beauty boost only applies while powered.
- **Install:** OK to install now. Safe to add mid-save.

6.4 Installation Checkpoint

- ✓ OK to install all mods in this chapter now.

6.5 Next Steps

Proceed to [Chapter 7: Gameplay Enhancements](#).

7 Chapter 7: Gameplay Enhancements

7.1 Learning Objectives

- Reduce tedious micromanagement
- Improve pawn AI to make smarter decisions automatically
- Add quality-of-life features that deepen strategy without making the game easier

7.2 Overview

7.3 The Mods

7.3.1 Fluffy Breakdowns (1.6 Update)

- **What it does:** Adds a maintenance system — powered buildings (refrigerators, comms consoles, fabricators, etc.) gradually accumulate breakdowns and need periodic repairs. A new “Maintenance” bill type lets you schedule fixing tasks. Breakdown severity escalates if ignored.
- **Why it’s here:** Vanilla buildings never break down, which means once you build something, you never think about it again. Breakdowns create a reason to maintain your colony — giving your constructors steady work between projects and adding a layer of logistics to mid-game base management.
- **Not OP because:** Breakdowns progress slowly and give plenty of warning. The maintenance work is mild — it doesn’t distract from survival. It adds depth without punishing the player. By Fluffy (reputable mod author known for balanced, well-designed mods).
- **Install:** OK to install now. Buildings will start accumulating wear. Safe to add mid-save.

7.3.2 Eccentric Tech - Fusion Power

- **What it does:** Adds the Multi-Mode Fusion Stellarator (MMFS) — a compact fusion reactor with multiple fuel modes (deuterium, tritium, helium-3), fuel extraction/production buildings, and ignition capacitors. 4 new research projects, 5 new resources, 7 new buildings.
- **Why it’s here:** Mid-to-late game power demands grow fast — especially with modded turrets, shields, and production chains. Fusion Power gives you a scalable, realistic upgrade path beyond vanilla geothermal/solar, without resorting to cheat-level generators.
- **Not OP because:** Reactors require costly startup (ignition capacitors), consume industrial fuels that must be produced or traded, and hull integrity degrades over time — forcing maintenance shutdowns. Pushing a degraded reactor risks a plasma vent that sets everything on fire.
- **Install:** OK to install if you have a stable mid-game colony with fabrication unlocked. Best on a new save due to world-gen trade ships.

7.3.3 Hacking Expansion

- **What it does:** Adds a hacking system with a craftable cyberdeck — hack mechanoid clusters, enemy turrets, and ancient structures to unlock superior technologies. Introduces new threats and challenges alongside the rewards. No DLC required, but integrates with all of them.
- **Why it’s here:** Vanilla hacking is limited to a few niche interactions. This mod turns hacking into a full gameplay system with meaningful risk-reward decisions: hack a cluster for rare tech? It might alert more mechanoids. The progression from basic cyberdeck to master hacker gives you a new vector for mid-to-late-game power advancement.
- **Not OP because:** Hacking requires crafting the cyberdeck first, then researching upgrades. Failed hacks have consequences — alerting enemies, damaging the cyberdeck, or triggering defensive countermeasures. The unlocked tech is powerful but gated behind risk. You can’t hack everything immediately.
- **Install:** OK to install now. Safe to add mid-save.

7.4 Installation Checkpoint

 OK to install all mods in this chapter now.

7.5 Next Steps

Proceed to [Chapter 8: Weapons & Combat](#).

8 Chapter 8: Weapons & Combat

8.1 Learning Objectives

- Expand the arsenal with balanced new weapons
- Improve combat AI and tactics
- Keep combat challenging — not easier

8.2 Overview

8.3 The Mods

8.3.1 Eccentric Tech - Advanced Shields

- **What it does:** Adds 3 advanced shield belts (Phased, Modulated, Layered) with unique mechanics — increased capacity, ranged-fire-through, and multi-layer shatter barriers. Crafted at the Nanoassembler.
- **Why it's here:** Vanilla shield belts are one-size-fits-all. These give you tactical choices: tank more damage but can't recharge mid-fight (Phased), shoot while shielded (Modulated), or shrug off heavy hits but die to fast fire (Layered).
- **Not OP because:** Each belt has a meaningful downside — longer recharge delay, lower total capacity, or vulnerability to certain weapon types. They require Eccentric Tech - Core and significant research to craft. CE-compatible natively.
- **Install:** OK to install now. Safe mid-save, but requires Eccentric Tech - Core.

8.3.2 Eccentric Extras - Flares

- **What it does:** Adds 10 illumination tools (torches, flares, flare guns, chemlights) and 7 utility apparel items (flare packs, chemlight packs, leg-pack variants). Also adds illumination mortar shells.
- **Why it's here:** Night battles and indoor fighting are brutally punishing without light. These give you tactical options to light up dark areas — affecting accuracy, work speed, and surgery success — without needing to build powered lamps everywhere.
- **Not OP because:** Flares and torches are consumable. Chemlights last longer but produce dimmer light. Auto-use logic has quirks (pawns may waste flares near doors). They illuminate rather than deal damage — purely tactical utility.
- **Install:** OK to install now. Safe to add mid-save.

8.3.3 Pulse Weaponry

- **What it does:** Adds 3 spacer-level pulse weapons (rifle, SMG, minigun), a pulse helmet, and a pulse turret. All share a distinct energy-weapon aesthetic and projectile effect.
- **Why it's here:** Late-game combat is dominated by charge rifles and lances. Pulse Weaponry diversifies the spacer-tier arsenal with balanced alternatives that have distinct fire patterns and trade-offs.
- **Not OP because:** Weapons are balanced against existing charge/plasma counterparts. The mod is focused and small — no power creep, just variety. Requires Athena Framework for projectile effects.
- **Install:** OK to install now for mid-to-late game colonies. Weapons require spacer tech research.

8.3.4 Spacer Arsenal

- **What it does:** Adds 7 new spacer-level guns with varied roles (Photon SMG, Thermite Shotgun, Clash HMG, etc.), plus a marine helmet and armor set.
- **Why it's here:** Gives the spacer tech tier more depth and variety — different weapons for different combat roles instead of “charge rifle for everyone.” Integrates into the existing Pulse-charged munitions research.

- **Not OP because:** Each weapon has its own niche with clear strengths and weaknesses. They're sidegrades to vanilla charge weapons, not upgrades. No required dependencies.
- **Install:** OK to install now for mid-to-late game colonies. Integrates with existing research.

8.3.5 Reel's Turret Pipeline

- **What it does:** Adds an ammunition pipe network that automatically refills connected turrets. Build ammo pipes from your storage to defensive positions — turrets pull ammo directly from the network instead of needing a pawn to manually rearm them.
- **Why it's here:** Manually rearming turrets is tedious and dangerous — pawns get shot lugging shells across the killbox. The pipe system turns turret maintenance from a constant chore into a one-time setup, letting you focus on tactics.
- **Not OP because:** You still need to produce the ammo. Pipes cost resources to build and space to route. A severed pipe line stops feeding until repaired. It automates logistics, not combat — your turrets still fire the same ammo at the same rate.
- **Install:** OK to install now. Safe to add mid-save.

8.4 Installation Checkpoint

8.5 Next Steps

Proceed to [Chapter 9: World Variety](#).

9 Chapter 9: World Variety

9.1 Learning Objectives

- Add new biomes, factions, and events to make every playthrough unique
- Expand exploration and world interaction
- Increase replayability without overpowering the player

9.2 Overview

9.3 The Mods

9.3.1 More Vanilla Biomes

- **What it does:** Adds 10 vanilla-friendly biomes including Glacial Shield, Badlands, Cloud Forest, Marsh, Stormy Savanna, Coastal Dunes, Sandbar, Alpine Meadow, Oasis, and Ice Floes. Each has distinct terrain, flora, and wildlife distributions.
- **Why it's here:** RimWorld's vanilla biomes are limited and can get repetitive. More Vanilla Biomes slots seamlessly into world generation with biomes that feel like they belong — no sci-fi gimmicks, just more variety for starting location choices.
- **Not OP because:** New biomes have balanced terrain and resource distributions. Some are harder (Ice Floes), some easier (Alpine Meadow). They don't add op items or mechanics. Has built-in compatibility patches for many animal and plant mods.
- **Install:** OK to install now, but best experience on a new world save. Requires Harmony. Compatible with most biome and world-gen mods.

9.4 Installation Checkpoint

9.5 Next Steps

Proceed to [Chapter 10: Monsters & Creatures](#).

10 Chapter 10: Monsters & Creatures

10.1 Learning Objectives

- Add new animal species, monsters, and threats to the world
- Balance new creatures so they're challenging but fair
- Integrate with existing RimWorld mechanics (taming, hunting, combat)

10.2 Overview

10.3 The Mods

10.4 Installation Checkpoint

10.5 Next Steps

Proceed to [Chapter 11: NPC Interactions](#).

11 Chapter 11: NPC Interactions

11.1 Learning Objectives

- Increase depth of faction relationships and diplomacy
- Expand quest variety and storytelling possibilities
- Make the world feel more alive with NPC interactions

11.2 Overview

11.3 The Mods

11.3.1 More Creepjoiners

- **What it does:** Adds 8+ new creepjoiner types to the Anomaly DLC. Includes the Tree Devourer (eat special trees for stacking buffs), Void Touched (craft indestructible voidmetal walls, transmute bioferrite limbs), and Highlander (steal abilities from other creepjoiners, killing them in the process). Each has unique abilities, drawbacks, and research projects.
- **Why it's here:** Vanilla creepjoiners get repetitive fast — you see the same few types every playthrough. More Creepjoiners makes Anomaly encounters feel fresh by introducing genuinely different joiners with real trade-offs. The Void Touched's voidmetal walls are a meaningful defensive tool without being a win button because they require Anomaly research first.
- **Not OP because:** Every creepjoiner has clear downsides. The Tree Devourer sacrifices trees your colony might need. The Highlander must kill other creepjoiners to steal their powers (losing their benefits permanently). Voidmetal walls require significant research investment and bioferrite. Requires Anomaly DLC.
- **Install:** OK to install now. Safe to add mid-save.

11.4 Installation Checkpoint

11.5 Next Steps

Proceed to [Chapter 12: Alien Breeding](#).

12 Chapter 12: Alien Breeding

12.1 Learning Objectives

- Understand RimWorld's genetic engineering systems
- Genetically modify colonists and animals
- Breed alien hybrids with unique traits

12.2 Overview

12.3 The Mods

12.4 Installation Checkpoint

⚠ Wait until you're established mid-game (Chapter 13 covers how to play with this setup). These mods add complexity best tackled after you've survived a few raids.

12.5 Next Steps

Proceed to [Chapter 13: Gameplay Guide](#).

13 Chapter 13: Gameplay Guide — A Full Modded Run

13.1 Learning Objectives

- Apply all previous mod chapters in a cohesive playthrough
- Understand how mods interact and compound over a full game
- Navigate early, mid, and late game with 100+ mods

13.2 Overview

13.3 Starting Your Modded Colony

13.4 Early Game (Days 1-30) — With Mods

13.5 Mid Game (Days 30-120) — With Mods

13.6 Late Game (Days 120+) — With Mods

13.7 Common Modded Pitfalls

13.8 Next Steps

Proceed to [Chapter 14: Troubleshooting](#).

14 Chapter 14: Troubleshooting

14.1 Learning Objectives

- Diagnose common mod-related issues
- Fix load order problems
- Recover from crashes without losing your colony
- Optimize performance when the game slows down

14.2 Overview

14.3 Common Issues

14.3.1 Game Crashes on Startup

14.3.2 Red Errors in Dev Mode

14.3.3 Performance Issues

14.3.4 Mods Not Working

14.3.5 Save File Issues

14.4 Getting Help

14.5 Next Steps

Congratulations! You've completed the guide. See [Appendix B: Resources](#) for community links and further reading.

15 Appendix A: Complete Modlist Reference

#	Mod Name	Category	Author	Steam Workshop ID
