

The Grand Chronicle

Sid Meier's Civilization VI

Complete Edition · Final build 1.0.12.68 (July 2024)

Two layers · 20 vanilla+ / 31 fully modded · Six Personas

Compiled August 2026 — for the last version of the game

1	Installation	4

4.7	6 · The Chronicler of Eras	22
4.8	How to start a persona run	22

1 Installation

Everything you need to go from a vanilla install to a fully modded chronicle — in two layers, with the right mod manager and a load order that stays stable.

1.1 What you need

- *The Complete Edition of Civ VI on Steam* — base game, **Rise and Fall**, **Gathering Storm**, the **New Frontier Pass**, and the **Leader Pass**. Every mod in this list targets the Gathering Storm ruleset, and several assume the later content.
- *A current game build*. The final version of the game is *1.0.12.68* (last update: July 15, 2024; the content roadmap had ended earlier with the Leader Pass in March 2023). Steam updates automatically — you are current if there is no pending update and the Leader Pass leaders appear in-game.
- *15 GB of free disk space* for the Workshop downloads.
- *Steam subscribed* to nothing else required — the Workshop does the downloading.

Good to know

This list is designed for the **last** version of the game. Mods that were not updated for the final build (e.g. old monolithic UI packs such as CQUI) are deliberately excluded — every mod below is verified to exist and remain in active use on the Workshop.

1.2 The mod manager: how Civ 6 actually does it

Civ 6 has *no community-standard external mod manager* — unlike Skyrim or Stellaris there is no widely used third-party tool, and Vortex is actively discouraged by the community. Instead, the power-user setup has three layers:

1. *The Steam Workshop* — this is where every mod lives and where subscribing **is** the installation. Subscribe to the items in Chapter 2 (or save them into your own Workshop **Collection** to reinstall in one click).
2. *Enhanced Mod Manager* — a Workshop mod by FinalFreak16 (over a million subscribers) that replaces the clunky in-game mod screen: it splits your mods into **enabled** and **disabled** lists, adds filters, and shows each mod's description and dependencies at a glance.
3. *The in-game Additional Content screen* — the game's own mod list (from the main menu: **Additional Content** → **Mods**). This is where you toggle mods for each game.

Tip

Subscribing is enough — the game detects Workshop mods automatically. You only need the local Mods folder when a mod is not on the Workshop (none in this list are).

1.2.1 Where the files live

- *Workshop mods*: Steam\steamapps\workshop\content\289070\<item id>\ — one folder per subscribed item.
- *Local mods*: Documents\My Games\Sid Meier's Civilization VI\Mods\

1.2.2 Load order: how conflicts are resolved

Civ 6 has *no drag-and-drop load order*. Each mod's .modinfo file declares a <LoadOrder> number: lower values load first, higher values load later and win conflicts.

LoadOrder	Intended phase
-100	Schema changes — data removal, core adjustments

-50	Premature updates — must run before content is added
0	Standard content — the default for most mods
50	Post-updates — applied after most content
100	Scenario updates — very last

For The Grand Chronicle this mostly takes care of itself: the mods in Chapter 2 are non-overlapping by design (one AI overhaul, cosmetic mods with known companions). If you **ever** need a mod to override another, edit that mod's .modinfo (raise its <LoadOrder>), keep a backup, and remember Steam will overwrite your edit on the next mod update.

1.3 Installation: Layer 1 first, then Layer 2

The list is split into two layers (see Chapter 2): *Layer 1 — Vanilla+* is 20 interface/graphics mods with zero gameplay change, the layer to learn on; *Layer 2 — The Grand Chronicle* adds 11 more (12 with the optional Extended Eras) — AI, tech tree, and content. Install them in that order.

Question	Layer 1 — Vanilla+	Layer 2 — The Chronicle	Who it is for
Gameplay changes	None — vanilla rules	AI, tech tree, resources, wonders	Layer 1: anyone learning or returning
Mods	20 (interface + graphics)	31 required / 32 with Extended Eras	Layer 2: players who know the systems
Game modes	All off	Monopolies & Barbarian Clans recommended	—
Typical difficulty	Prince–King	King–Emperor	—
When to move on	Systems feel familiar	When you want the chronicle	—

1. *Install and launch the game once* (vanilla) to generate your settings and confirm the build works.
2. *Subscribe to Layer 1* — the 20 items under Layer 1 in Chapter 2, plus *Enhanced Mod Manager* ([Workshop item 1601259406](#)) — 21 subscriptions total. Steam downloads them in the background.
3. *Verify and enable* — the items appear in workshop\content\289070\ when complete; launch the game, open **Additional Content** → **Mods**, and move every subscribed item to the enabled list.
4. *Play Layer 1* with the settings from Chapter 3 (game modes off) — this is the vanilla game, readable and pretty. Stay here until the systems feel familiar.
5. *Graduate to Layer 2* — subscribe the remaining 11 items (12 with Extended Eras) listed under Layer 2 in Chapter 2. They join the enabled list automatically.
6. *Order check* — no action needed; the load order comes from the mods' own .modinfo values, and the Layer 2 mods are designed to layer cleanly on top of Layer 1.
7. *Optional: build two Collections* — in the Workshop, save the Layer 1 set and the Layer 2 set as two separate collections, so reinstalling either layer is one click.

Watch out

Do *not* stack the AI overhaul with other AI mods (AI+, RHAI, Better Balanced Game) — mixing them produces erratic AI behavior. Chapter 2 includes exactly one AI mod for this reason.

Tip

Switching between layers mid-save is safe in one direction only: you can enable Layer 2 mods on an existing Layer 1 game (content is added), but disabling Layer 2 mods on an active Layer 2 game can confuse it. Start the save you care about at the layer you want to finish in.

1.4 Troubleshooting

- *Crash on the leader screen / at game start* — Civ 6 has a hard-coded asset limit for animated leaders and high-detail assets. Disable the newest high-asset mods you added last and re-test. In this list the heaviest asset mod is *Resourceful 2* (51 new resources) — disable it first if you hit the limit, or swap to a lighter Layer 2 by skipping it.
- *Mod shows as “incompatible”* — the game flags mods whose declared compatibility predates the current build. The mods in this list are verified to load on 1.0.12.68 (data-only mods like Real Tech Tree have needed no changes since 2020); if one ever flags, check its Workshop page for an update before removing it.
- *Odd behavior after a Steam update* — Steam may overwrite .modinfo edits or a mod update changes things. Re-check the affected mod’s notes.
- *Still broken?* — Verify game files (Steam → right-click Civ VI → Properties → Installed Files → Verify), then delete the Cache folder under Documents\My Games\Sid Meier's Civilization VI\ and relaunch. Disable mods one at a time to isolate the culprit.

2 The Modlist

Thirty-two verified mods (31 required, one optional) in two installation layers. Every entry was checked against its live Steam Workshop page (author, item id, update date) at the time of writing. None of them make the game easier or hand you power — they make the AI think, the map beautiful, and your decisions informed.

2.1 The two layers

The list is deliberately split in two, because “learning the game” and “playing the full chronicle” need different setups:

- *Layer 1 — Vanilla+ (20 mods)*: interface and graphics only. **Zero gameplay changes** — the rules are exactly the vanilla game, just readable and prettier. This is the layer to learn on: everything you learn transfers 1:1 to unmodded play.
- *Layer 2 — The Grand Chronicle (31 mods + 1 optional)*: Layer 1 plus the AI overhaul, the tech-tree suite, and the content mods. This is the fully modded game — the AI plans, the tech tree is historical, and the world is full of resources, wonders, and things to discover.

Start in Layer 1, graduate to Layer 2 when the vanilla systems feel familiar. The installation chapter covers both flows.

2.2 Layer 1 • Vanilla+ — learn the game

2.2.1 Interface & Information (14)

UI mods that reveal information the vanilla interface hides. None change balance — they turn guessing into planning. On this layer, that’s the whole point: you learn the **real** rules, only with a cockpit you can read.

Quick Deals

by wltk

What it does: Shows every AI’s offer for the items you want to trade in one sorted window (hotkey D), so you can sell to the highest bidder with one click.

Why it's in the Chronicle: Trade transparency: you see the market instead of blind-clicking leaders.

Compatibility: UI-only; works with everything.

Detailed Map Tacks

by wltk

What it does: Map tacks now compute and display the actual yields and adjacency bonuses a district or wonder would get at that spot — before you commit.

Why it's in the Chronicle: City planning becomes a real craft: you plan districts the way the game's systems reward.

Compatibility: UI-only; pairs with the Map Lens in More Lenses.

Extended Policy Cards

by Aristos

What it does: Shows the concrete effects of every policy card on your current empire (e.g. +3 Gold, +2 Culture) instead of vague prose.

Why it's in the Chronicle: Government choices stop being memorization — you see the trade-off your empire actually faces.

Compatibility: Requires Better Report Screen (below) to display the effects. Works with vanilla, R&F and GS.

Extended Diplomacy Ribbon

by Aristos

What it does: Adds an at-a-glance ribbon showing each leader's government, military strength, amenities, and current diplomatic stance toward you.

Why it's in the Chronicle: Diplomacy becomes readable: you know who is friendly, who is posturing, and who to bribe.

Compatibility: UI-only; works with vanilla, R&F and GS.

Better Report Screen (UI)

by infixo

What it does: Reworks the report screen with far more information and new tabs: units, deals, policies, and city-states.

Why it's in the Chronicle: Empire-wide bookkeeping — the backbone that Extended Policy Cards draws on.

Compatibility: Required by Extended Policy Cards. Safe with all official scenarios.

Better Civilopedia (UI)

by infixo

What it does: The Civilopedia now shows decoded modifiers, district adjacencies, and AI strategies — the actual numbers behind the prose.

Why it's in the Chronicle: The reference book becomes worth opening: you can learn how the systems really work.

Compatibility: UI-only; language-independent.

Better Tech Tree (UI)

by infixo

What it does: Shows far more information in the tech and civic trees and adds ~150 unique icons, so you can read prerequisites, costs, and unlocks at a glance.

Why it's in the Chronicle: The tree is where the whole game is planned — making it legible belongs in the learning layer.

Compatibility: UI-only; designed by the same author as the Layer 2 tech mods it will sit beside later.

More Lenses

by astor

What it does: Adds lenses for settler placement (highlighting settleable spots), adjacency, appeal, and more to the map lens menu.

Why it's in the Chronicle: The map tells you what your empire could become, not just what it is.

Compatibility: UI-only. Already bundled inside CQUI/HBUI — we don't use those, so this is the standalone version.

Better Trade Screen

by astor

What it does: Trade routes become sortable and filterable by yield (food, production, gold, science, culture, faith) with multi-level sorting.

Why it's in the Chronicle: Managing a trade empire is a real strategic layer once you can see every route's value.

Compatibility: UI-only; do not combine with CQUI/HBUI.

Production Queue

by Lozenge

What it does: Adds production queues to cities: left-click appends, Ctrl-click or middle-click inserts at the top; drag to reorder.

Why it's in the Chronicle: Late-game city management without endless re-selecting — a quiet quality-of-life depth add.

Compatibility: UI-only; does not work in hotseat games.

Great Works Viewer

by Glindor

What it does: Improves the Great Works screen: sort by building type, expand to full screen, filter by work slot, and a theming helper.

Why it's in the Chronicle: The culture game becomes legible — you can actually plan theming bonuses.

Compatibility: UI-only.

Sukritact's Simple UI Adjustments

by sukritact

What it does: A set of small quality-of-life changes: worked tiles, next border growth and city yields on hover, easier citizen management, and more.

Why it's in the Chronicle: The 'details' layer — small conveniences that make reading your empire effortless.

Compatibility: UI-only; updated October 2024, the most recently maintained item in this category.

Sukritact's Global Relations Panel

by sukritact

What it does: One panel showing how every civilization feels about every other — opinions, agreements, and agendas at a glance.

Why it's in the Chronicle: You finally see the diplomatic web you are playing inside, not just your own inbox.

Compatibility: UI-only.

Better Combat Preview (UI)

by Maple_Leaves

What it does: Rich combat previews: current HP, strength differences, damage ranges, and likely results, with a detailed breakdown when many factors are at play.

Why it's in the Chronicle: War becomes calculation instead of gambling — you commit to fights you can read.

Compatibility: UI-only; does not cover air combats.

2.2.2 Graphics & Immersion (6)

Six visual mods that make the map calmer, richer, and easier to read. All cosmetic; none touch gameplay numbers.

Environment Skin: Sid Meier's Civilization V

by GrrrrArrrg

What it does: Re-textures terrain and shifts the color key toward Civ V's calmer, more muted palette, with more detailed terrain textures.

Why it's in the Chronicle: If Civ VI's saturated 'board-game' look wears on you, this is the classic one-stop visual modernizer.

Compatibility: Compatible with every release up to and including Gathering Storm; designed to work with Hillier Hills and Vegetation mods.

Hillier Hills

by Deliverator23

What it does: Changes the heightmap of hills so they are more prominent and visibly elevated — terrain reads better at a glance.

Why it's in the Chronicle: Readable terrain is strategy you can see: chokepoints and defensive hills jump out.

Compatibility: Compatible with Environment Skin and Denser Vegetation. Incompatible with Leugi's Colder Tundra (a combined version exists if you ever want it).

City Sprawl Graphics

by Hiraeth

What it does: Buildings now appear on the outskirts of districts placed adjacent to the city centre — your metropolises visually sprawl as they grow.

Why it's in the Chronicle: The 'living empire' feeling: growth you can see on the map.

Compatibility: Visual only; a heavier asset mod, so it is a candidate to disable first if you ever hit the leader-asset crash limit.

Denser Vegetation (for Civ V Skin)

by JNR

What it does: Dense, forest-like vegetation with terrain-tinted variants so you can still tell what lies underneath; entirely cosmetic.

Why it's in the Chronicle: Forests become forests — the map stops looking like a garden and starts looking like a continent.

Compatibility: Use this 'for Civ V Skin' version because we run Environment Skin (the standalone version targets the default skins). Enable the 'High-Detail Clutter' graphics option for full effect.

Colorized Historic Moments

by MiniRagnarok

What it does: Replaces the historic-moment art with colorized artwork — over 250 moments colorized.

Why it's in the Chronicle: Your empire's history book gets the detail it deserves; can be enabled/disabled without touching saves.

Compatibility: Visual only.

Prettier Lakes

by pokiehl

What it does: Enhances the flat water textures of lakes, oases, and several natural wonders (Dead Sea, Crater Lake, Lake Victoria, and more).

Why it's in the Chronicle: Small water detail that noticeably improves map photography.

Compatibility: Visual only; includes a variant texture for Terra Mirabilis's Lake Victoria.

2.3 Layer 2 · The Grand Chronicle — the fully modded game

Everything from Layer 1, plus the mods that change how the game thinks. This is where the Chronicle actually begins.

2.3.1 AI & Strategy (1)

Real Strategy (AI)

by infixo

What it does: A different approach to making the AI better: a mixture of Lua 'thinking' and tuned AI lists. The AI plans districts and units coherently, pursues victory types, and handles war and naval play sensibly instead of drifting.

Why it's in the Chronicle: This is the 'more AI' request in one package — a smarter opponent that respects the game's own systems, which raises the challenge without cheating.

Compatibility: Do not combine with AI+, RHAI or Better Balanced Game. Designed to sit alongside the author's other mods below.

2.3.2 Technology (3, plus 1 optional)

The 'more tech' request: a tree that makes historical sense, research boosts that surprise you, and — if you want it — eras that last long enough to live in.

Real Tech Tree

by infixo

What it does: Rearranges the tech and civic trees to be more historically accurate and logical: new connections patch the omissions that let players beeline two eras ahead, and same-era techs cost comparably.

Why it's in the Chronicle: Research becomes a historical path instead of a spreadsheet — the 'more tech' request in one mod.

Compatibility: Data-only (tree connections and costs); stable since 2020. Designed by the same author as Real Strategy and the rest of this section.

Real Eureka

by infixo

What it does: Over 500 new eureka and inspiration conditions, randomly assigned to techs and civics — every game's boost map is different.

Why it's in the Chronicle: Replayability: you can't memorize the tree's shortcuts, so each chronicle researches its own way.

Compatibility: Version 3+ works with Better Tech Tree (Layer 1). Honest note: it makes research planning less predictable — that's the point.

Extended Eras (optional)

by pokiehl

What it does: Adjusts research costs so eras last longer without making the game unbearably long; also stops civilizations from rushing ahead or falling too far behind.

Why it's in the Chronicle: The pacing choice for chronicle-style games — each era gets played out instead of flown past. Pairs perfectly with the Chronicler persona.

Compatibility: Pacing-only; works on all game speeds. Optional: skip it if you prefer the standard game length.

2.3.3 World & Content (8)

New resources, new wonders, dynamic names, and the map pack — additions, not power spikes.

Resourceful 2

by Amatheria

What it does: Adds 51 new resources (bonus, luxury, and strategic) across pastures, quarries, mines, and camps; all luxuries can be harvested; pantheons and Monopolies & Corporations support included.

Why it's in the Chronicle: The resource depth request: economies get more things to improve, trade, and monopolize.

Compatibility: Fully compatible with the New Frontier Pass and the Monopolies & Corporations game mode. No documented conflict with Sukritact's Resources. It is the heaviest asset mod in the list — see the crash troubleshooting in Chapter 1.

Luxury Resource Variety

by pokiehl

What it does: Increases the number of unique luxury kinds on each map size, so economies look different every game (it does not change the total amount of luxury tiles — that stays tied to the resource setting).

Why it's in the Chronicle: More variety in what you trade and monopolize; the Merchant Republic persona is built on it.

Compatibility: Requires Resourceful 2 (present in this layer) or Sukritact's Resources + Civitas Resources.

Sukritact's Resources

by sukritact

What it does: Adds new resources across the board: Cheese, Camels, Obsidian, Gold (mine), Bison, and more, each with sensible yields on their improvement.

Why it's in the Chronicle: Richer economies — more luxuries and bonuses to trade, improve, and fight over.

Compatibility: Content mod, balanced yields; sits alongside Resourceful 2 without documented conflicts.

Terra Mirabilis

by Deliverator & ChimpanG

What it does: Reworks the natural wonders and adds 20 new ones, including fan favourites: Victoria Falls, Rock of Gibraltar, Krakatoa, Lake Victoria, Cerro de Potosí and more.

Why it's in the Chronicle: The world gets more places worth exploring, settling, and fighting over — classic content depth.

Compatibility: Content mod; the wonders integrate with the base ruleset. Pairs well with Prettier Lakes.

Rosetta — Dynamic City Names

by SeelingCat

What it does: Cities change their names to match their owner's culture, and duplicate names never appear in the same game — a conquered York becomes Eboracum again.

Why it's in the Chronicle: The map tells a story of conquest and culture; fully modular across mods and DLC.

Compatibility: Flavor mod; works regardless of enabled DLC.

Sukritact's Oceans

by sukritact

What it does: A brand new game mode: kelp forests teem the coasts, new ocean resources (seals, squid, coral) appear, and the seas gain real gameplay.

Why it's in the Chronicle: Oceans stop being a blue void — the map's coasts become a strategic layer of their own.

Compatibility: Game mode toggled in Advanced Setup. May not be fully compatible with the Yet (not) Another Maps Pack — pick per game (details in Chapter 3).

Wetlands

by JNR

What it does: Adds real gameplay around wetlands: new tiles, yields, and decisions for the world's most productive — and most neglected — terrain.

Why it's in the Chronicle: Marshes become a strategic choice instead of filler terrain.

Compatibility: Requires Gathering Storm. Incompatible with mods that let you harvest all resources.

Yet (not) Another Maps Pack

by Gedemon

What it does: The classic map pack: dozens of real and fantasy maps including True Start Earth, with realistic continents and start positions.

Why it's in the Chronicle: The grand-chronicle way to play — the actual Earth, with real starting locations.

Compatibility: Maps only. Keep map size at Enormous or smaller — sizes above Enormous crash late-game on the Gathering Storm build. If you want Sukritact's Oceans in the same game, prefer standard map scripts over YnAMP maps.

2.4 The list at a glance

A quick index for subscription and re-checking. Items are grouped by layer, then by category.

Layer	Category	Mod	Author
1	Interface	Quick Deals	wltk
1	Interface	Detailed Map Tacks	wltk
1	Interface	Extended Policy Cards	Aristos
1	Interface	Extended Diplomacy Ribbon	Aristos
1	Interface	Better Report Screen (UI)	infixo
1	Interface	Better Civilopedia (UI)	infixo
1	Interface	Better Tech Tree (UI)	infixo
1	Interface	More Lenses	astor
1	Interface	Better Trade Screen	astor
1	Interface	Production Queue	Lozenge
1	Interface	Great Works Viewer	Glindor
1	Interface	Sukritact's Simple UI Adjustments	sukritact
1	Interface	Sukritact's Global Relations Panel	sukritact
1	Interface	Better Combat Preview (UI)	Maple_Leaves
1	Graphics	Environment Skin: Civ V	GrrrrArrrg
1	Graphics	Hillier Hills	Deliverator23
1	Graphics	City Sprawl Graphics	Hiraeth
1	Graphics	Denser Vegetation (for Civ V Skin)	JNR
1	Graphics	Colorized Historic Moments	MiniRagnarok
1	Graphics	Prettier Lakes	pokiehl
2	AI & Strategy	Real Strategy (AI)	infixo
2	Technology	Real Tech Tree	infixo
2	Technology	Real Eureka's	infixo
2	Technology	Extended Eras (optional)	pokiehl
2	Content	Resourceful 2	Amatheria
2	Content	Luxury Resource Variety	pokiehl
2	Content	Sukritact's Resources	sukritact
2	Content	Terra Mirabilis	Deliverator & ChimpanG
2	Content	Rosetta — Dynamic City Names	SeelingCat
2	Content	Sukritact's Oceans	sukritact
2	Content	Wetlands	JNR
2	Content	Yet (not) Another Maps Pack	Gedemon

2.5 Deliberately not in this list

- *CQUI / HBUI* — monolithic UI overhauls that bundle several of the mods above; they are stale relative to the final build and superseded by the individual, maintained mods.
- *Better Balanced Game (BBG)* — a competitive multiplayer rebalance; it re-tunes the whole economy and conflicts with the ‘deepen, don’t rebalance’ goal, and it must not sit next to Real Strategy.
- *AI+ / RHAI* — fine mods on their own, but AI overhauls do not stack; Real Strategy is the single choice here.
- *Heroes & Legends, Zombie Defense, Apocalypse* game modes — gimmicks and power spikes that make the game easier or weirder.
- *Cheat-y research mods* (faster techs, gold-bought research) and stale tree reworks that **remove** techs (e.g. Tech Tree Rework) — the opposite of this list’s charter.
- Anything that hands the player free yields, cheaper units, or faster tech — that is the opposite of this list’s charter.

3 How to Play

*This chapter assumes you know the shape of a 4X game but want to play Civ VI **well** with The Grand Chronicle installed — what to set up, which game modes earn their place, and how to read the game with the mods’ new lenses, era by era.*

3.1 Which layer are you playing?

- *Layer 1 — Vanilla+ (learning)*: the rules are 100% vanilla. Everything in this chapter applies, but you can ignore the technology and content notes — the tree is the vanilla tree, the resources are the vanilla set. Play with all game modes off; that is what “learning the game” means here.
- *Layer 2 — The Grand Chronicle (fully modded)*: Layer 1 plus the AI and content. What changes: the AI thinks like a rival great power (Real Strategy); the tech tree is rearranged to be historical (Real Tech Tree) and its boosts are randomized every game (Real Eurekas); the world has 60 extra resources (Resourceful 2, Sukritact’s Resources), 20 extra natural wonders (Terra Mirabilis), wetlands that matter, dynamic city names, and an optional oceans game mode. This chapter’s technology and content sections are written for this layer.

3.2 Creating your game: the Chronicle baseline

From the main menu choose **Single Player** → **Create Game** and open **Advanced Setup**. This baseline works for every persona in Chapter 4:

Setting	Chronicle baseline
Map type	Continents (or Pangaea for a bloodier game; Fractal for variety; YnAMP True Start Earth for the Chronicler persona)
Map size	Standard (Large is fine on strong PCs; YnAMP: never above Enormous)
Game speed	Standard (Epic for the Chronicler persona — eras last longer, the world gets to breathe)
Difficulty	King to start; Emperor once the AI mod feels comfortable; Prince for pure sandbox
Disaster intensity	2 (moderate climate events; 4 if you want Gathering Storm to bite)
Start position	Legendary (fair starts; the game is hard enough without rerolling)
World age	New (more hills — pairs beautifully with Hillier Hills)

Resources	Standard (Abundant if you want a friendlier economy , not an easier game)
Rainfall	Standard (Wet gives Wetlands terrain more presence)

3.2.1 The settings, explained

- *Map type* — decides the world’s shape: Continents (landmasses divided by ocean — the balanced default), Pangaea (one giant landmass — wars and rivalries), Fractal (unpredictable), Archipelago (maritime), or one of YnAMP’s real maps in Layer 2.
- *Map size* — Standard (8–10 civs) is the balanced default; larger maps mean more rivals and longer games, and YnAMP maps above Enormous risk late-game crashes.
- *Game speed* — Standard is the reference pace; Epic stretches it by a third so eras last longer; Marathon is a lifestyle.
- *Difficulty* — the AI’s handicap: higher levels give the AI more starting units and faster growth. It does not make the AI smarter — that is Real Strategy’s job in Layer 2.
- *Disaster intensity* — scales climate events from 0 (off) to 4 (cataclysmic). Gathering Storm’s floods, droughts and storms are a strategic layer; start at 2.
- *Start position* — Legendary gives fair, strong starts; random can be brutal. The modded game is hard enough without rerolling for a perfect spawn.
- *World age* — New = more hills, Old = more flatland. Hills give production and defensible terrain; New pairs beautifully with Hillier Hills.
- *Resources* — Standard is the reference; Abundant gives a friendlier economy (more luxuries, more amenities), not an easier game.
- *Rainfall* — Wet creates more marshes and woods (which feeds the Wetlands mod in Layer 2); Arid creates deserts.

Tip

The **number of civilizations** is worth tuning: 8 civs on Standard keeps the map competitive without crowding. The mods don’t change how many civs fit a map.

3.2.2 Game modes: which earn their place

Game modes are official DLC toggles in Advanced Setup — choose them per game, not per install. On Layer 1, leave them all off: the point of that layer is the vanilla rules. On Layer 2, the table below is your guide.

Mode	Verdict	Why
Monopolies & Corporations	<i>Recommended</i>	Economic depth: monopolies, corporations, products, and a tourism hook. The single best ‘deepen the economy’ mode — the Merchant Republic persona is built on it.
Barbarian Clans	Recommended	Barbarian camps become evolving clans that can be hired or recruited into city-states — more texture, not more power.
Dramatic Ages	Optional	Ages swing hard, cities can flip, dark ages bite. Deeper and harder — for the Chronicler and veterans.
Secret Societies	Optional	Four fantasy societies with strong bonuses. Honest note: this is the most power-giving mode, so it sits on the optional shelf, not the default.
Heroes & Legends	Leave off	Heroes are flat power spikes — the exact thing this list avoids.

Apocalypse / Zombie Defense	Leave off	Gimmick modes; they skew the world toward spectacle rather than strategy.
Sukritact's Oceans	Per game	A mod game mode (Chapter 2). Great on standard map scripts; skip it on YnAMP maps.

3.3 Reading the game with The Grand Chronicle

The UI mods are not decoration — they change **how you make decisions**:

- *Quick Deals* turns diplomacy into a market. Sell luxuries and strategics the moment they are spare; check every leader's offer before spending a trade turn.
- *Detailed Map Tacks* makes districts a planning puzzle. Before you settle, tack out the campus/holy site/government plaza chain you want; the tacks show the adjacency math before you commit tiles.
- *Extended Policy Cards* removes the “card amnesia”: swap policies when the numbers say so, not from memory. Revisit after every new district or war declaration.
- *Extended Diplomacy Ribbon + Global Relations Panel* give you the diplomatic map: who is weak, who is friendly, who everyone hates. Use it — grievances and alliances are visible strategy.
- *Better Combat Preview* changes war: you see damage ranges before you attack. Ambushes and favorable terrain become things you **engineer**, not hope for.
- *Better Report Screen* is your endgame dashboard: units, deals, policies, minors — one screen to plan your victory push.
- *Better Tech Tree* (and, on Layer 2, the Real Tech Tree reorder) makes the research path legible: prerequisites, costs, and unlocks at a glance, so you can see what beelining actually costs you.
- *Real Strategy* makes the AI behave like a player with a plan. Respect it: the AI now builds districts that make sense, which means it **will** have an economy by the Renaissance. Early aggression windows are real, but so are its counterattacks.

3.4 Your first 100 turns

A skeleton for a strong opening, whichever layer you are on:

- *Turns 1–10 (the scout phase)*. Build order: scout → slinger → builder (or settler on a very strong start). Move the scout in a widening spiral to meet city-states and neighbors — the first-meet envoy is free influence, and knowing the map beats hoping.
- *Turns 11–30 (the second city)*. Choose the second settle site while scouting: fresh water, a strategic luxury, or a district-adjacency cluster (tacks make this visible before you commit). A city that cannot grow is a city that cannot pay for itself.
- *Turns 31–60 (the economy turns)*. Third city, one district per city, and the first eureka chases. On Layer 2, Real Eureka's randomizes the boost conditions, so read each tech's tooltip this game instead of relying on memory.
- *Turns 61–100 (the era pivot)*. Governments arrive, governors get placed, and you commit to a victory direction — Chapter 4's personas tell you which. A Classical Golden Age here compounds for the rest of the game.

3.5 Era by era

3.5.1 Ancient Era — the first forty turns

- *Open* with a scout (or two) and a slinger: meet city-states for free first-meet envoys, find your neighbors, and grab the tribal villages.
- *Settle on fresh water* (river or coast) and **plan before you plant**: your first three cities should have room to grow into their districts. Drop tacks now, settle accordingly.
- *Tech eureka culture*: don't research blind — read what boosts a tech (build that pasture, meet that civ) and let the boosts pull you forward. This is the game's hidden skill floor. (Layer 2 with Real Eureka's: the

boost conditions are randomized each game, so the skill becomes **discovering** them — hover the tech and read what this game's boost is.)

- *Combat*: slingers with the warrior are enough to clear camps. Do not over-build military in a peaceful opening — every unit is a missed settler.

3.5.2 Classical & Medieval — governments and golden ages

- *Era score is a resource* (Rise & Fall / Gathering Storm). Aim for a Golden Age in the Classical era — the Legacy bonuses compound for the rest of the game.
- *Governors* (R&F/GS): Magnus (settler/chopping economy), Pingala (science/culture), Liang (builder safety). Move them deliberately; their promotions are long-term investments.
- *Policy economy*: with Extended Policy Cards, you can **see** when a military card beats a growth card. Re-swap every few turns — that's the actual government minigame.
- *Loyalty* (R&F/GS): don't settle inside your neighbor's pressure bubble unless you plan to take their cities next. Foreign cities flip; yours can too.
- *Wonders*: pick two or three per era that match your victory (Chapter 4 personas say which). With Real Strategy installed, the AI races you — check the wonder screen and pivot when beaten.
- *Research path* (Layer 2): Real Tech Tree reorders prerequisites to be historical — don't assume the vanilla chain. Open the tree (Better Tech Tree makes this easy) and chart your path before you commit.

3.5.3 Renaissance & Industrial — the economy era

- *Trade routes are your second economy* (Gathering Storm makes them even more vital). With Better Trade Screen, sort by gold/science and keep every route filled — internal routes grow new cities, external routes make money and spread religion.
- *Corporations* (if Monopolies & Corporations is on): monopolies come from controlling a luxury's sources — trade for them, don't gift them. Products are endgame gold. (Layer 2: with Resourceful 2 and Luxury Resource Variety there are far more luxuries in play — and therefore more monopolies to chase.)
- *Great People*: with Real Great People, the window shows portraits and points. Plan **which** great person you want and protect your lead in that category — don't let a neighbor's Theatre Square out-accumulate you.
- *Alliances*: a Research or Economic Alliance with the right neighbor is compounding value. The Global Relations Panel shows who's actually reliable.

3.5.4 Modern & Atomic — the war era

- *War is a calculation now*: use Better Combat Preview to confirm fights before committing. Corps and armies (GS) double your punch — but oil gates the good stuff.
- *Power* (GS): plan power districts (Industrial Zones, Dams, power plants) before you need them; running out mid-war is a classic collapse.
- *Spies*: a handful of spies doing missions (steal great works, siphon gold, disrupt rocketry) is more value than any wonder this era. Assign them like governors.
- *Diplomacy under pressure*: the ribbon shows who's arming up. If a neighbor's strength is spiking, that's your war warning — bribe their target, or be the target.

3.5.5 Information & Future — the victory era

- *Pick your lane in Chapter 4's roadmap and commit*. Late-game Civ VI punishes dithering more than any other era.
- *Production Queue earns its keep*: queue up space-race projects, districts, and wonder chains so no city idles.
- *Climate* (GS): carbon emissions drive sea-level rise; coastal cities flood. If you're the top polluter, expect the world congress to tax you.

- *The endgame dash*: science → Mars; culture → rock bands and tourism; diplomacy → world congress votes; domination → the last capitals. Watch all four progress meters in the victory screen — the AI is pushing its own lane.

3.6 Empire systems, in depth

3.6.1 Districts and adjacency

The heart of Civ VI's planning: every district's yield is adjacency-driven. Campuses and Holy Sites love mountains and reefs; Industrial Zones love aqueducts and dams; Commercial Hubs and Harbors love rivers and each other. The Government Plaza chain and the district-discount mechanic reward planning your first three cities as one system. Detailed Map Tacks exists for exactly this — tack before you settle.

3.6.2 Housing and amenities

Growth needs housing (fresh water, farms, granaries, neighborhoods) and contentment needs amenities (luxuries, Entertainment Complexes, policies). A city at its housing cap stops growing; a city short on amenities bleeds production and can riot. On Layer 2 the 60 extra resource types (Resourceful 2, Sukritact's Resources) make amenity trading a real market — and Luxury Resource Variety means each map's luxury mix is different.

3.6.3 Loyalty

Rise & Fall's pressure system: nearby foreign cities push on your borders, and low loyalty flips cities to free cities or a neighbor. Pressure comes from population, proximity, governors, garrisons, and civics. If you conquer, expect to hold your prize under pressure; if you forward-settle, expect the same treatment back.

3.6.4 Grievances and diplomacy

Gathering Storm's grievance system prices every war: declare without cause and the world accrues grievances against you; a justified war (promises broken, denouncements honored) keeps them low. The Extended Diplomacy Ribbon and Global Relations Panel turn this from fog into a readable board — check them every few turns, not just when war breaks out.

3.6.5 Religion and the faith economy

Founding a religion is a build order, not an accident: Holy Sites and Great Prophet points from the early game, then beliefs that match your victory (Work Ethic for production, Choral Music for culture, Feed the World for growth). Faith buys apostles, then districts and buildings under Theocracy. Even a secular empire should defend against conversion — foreign religion on your cities is foreign influence on your yields.

3.6.6 City-states

Every city-state grants a Suzerain bonus to whoever holds the most envoys (first meet = 1 free envoy; 3 = Suzerainty). Bonuses range from production and unit discounts to diplomatic favour and unique units. Envoys are one of the best early investments in the game — the report screen's minors tab (Better Report Screen) tracks every relationship.

3.6.7 Tourism and the culture victory

Culture victory is a tourism race: great works, wonders, relics, seaside resorts, rock bands, and — on Layer 2 with Monopolies & Corporations — monopolies that multiply tourism. Theming bonuses (museums holding the same era and type) double their output; Great Works Viewer exists to plan them. Watch the tourism lens: it shows exactly who is converting whom.

3.6.8 Spies

A handful of spies doing missions — sabotage rocketry, siphon gold, steal great works, recruit partisans — is more value than any wonder in the modern era. Assign them like governors, promote them, and expect the AI's spies in your own spaceport cities; counter-spy where it hurts.

3.6.9 Power and climate

Gathering Storm adds power (coal, oil, uranium, renewables) and climate: emissions drive sea-level rise, disasters scale with intensity, and the World Congress votes on carbon taxes. Plan power districts before you need them — running out of power mid-war is a classic collapse. Clean energy is an endgame science flex that also keeps the congress happy.

3.6.10 Governors

Governors are your empire's staff: Magnus (settler and chopping economy), Pingala (science/culture in one city), Liang (builder safety), Reyna (gold), Moksha (faith), Victor (defense), Amani (city-state influence). Their promotions are long-term investments — move them rarely and promote deliberately.

3.7 Pitfalls that end runs

- *Settling on faith.* Every city needs a plan: fresh water, growth, and a district cluster. Three cities that can grow beat six that cannot work.
- *Ignoring amenities.* The yield loss from negative amenities quietly kills a mid-game empire. Keep the luxuries coming, or build Entertainment.
- *No army, no allies.* The AI (especially under Real Strategy) reads weakness. A standing core army and one real alliance are cheap insurance.
- *Beelining without a plan.* One tech to a wonder is fine; ten techs to a fantasy is how you fall two eras behind. Chart the tree — Better Tech Tree makes this painless.
- *Wonder greed.* Rushing a wonder the AI is also building wastes a city's production. Check the wonder screen and pivot when beaten.
- *Forgetting era score.* A Dark Age is a setback, not a reset — but two in a row is a spiral. Plan golden-age triggers (firsts, great people, wonders, disasters survived).
- *Playing every victory at once.* Commit by the Industrial era; the Layer 2 AI certainly does.
- *No spies in the endgame.* Disrupting a rival's Mars project or spaceport is the difference between winning and watching the AI win.

3.8 Victory roadmaps

- *Science* — the reliability pick. Campuses in every city, universities as soon as they exist, and the spaceport in your Pingala city with Production Queue stacked on its projects. Research alliances compound your lead. On Layer 2, Real Tech Tree makes the path to rocketry more historical — chart it early with Better Tech Tree. **Persona: The Cradle of Science.**
- *Culture* — the accumulation pick. Theatre squares, wonders, artifacts, then rock bands in the late game; monopolies multiply tourism if that mode is on. Theming bonuses are the difference between good and great, and Great Works Viewer plans them. **Persona: The Architect of Wonders.**
- *Domination* — the momentum pick. One early war to cripple a neighbor, then snowball — but Real Strategy's AI punishes a stalled war, so every campaign needs corps, oil, and a plan. **Persona: The Iron Chancellor.**
- *Diplomatic* — the currency pick. Win World Congress votes by banking diplomatic favour: build Statue of Liberty, win aid competitions, keep everyone friendly. It is the victory that lives and dies on the Global Relations Panel. **Persona: The Merchant Republic.**
- *Religious* — the patience pick. Found early, spread hard, defend apostles; theological combat is real combat, and Inquisition keeps your own cities loyal. **Persona: The Faithful Pilgrim.**
- *Score* — the fallback pick. If nobody wins before the clock runs out (Standard speed: turn 500), the best empire wins on score — so play a clean game and let the chronicle outlast everyone. **Persona: The Chronicler of Eras.**

Good to know

One game, one persona. Chapter 4 turns these roadmaps into characters — with the exact creation choices each one needs.

4 Personas

Who are you in this chronicle? Six ways to play the same modded world — each with a background, and the game-creation choices that make it yours.

4.1 Before you start: how “creation” works here

Civ 6 has no character creator — your identity comes from the choices in **Advanced Setup** and the rules you keep:

- *The civilization and leader.* This is your kit: unique district, unique units, leader ability. Each persona pairs them with a victory lane.
- *The map and the world.* Map type, size, speed, and game modes shape **how** the story plays out — an archipelago is a different chronicle than a Pangaea.
- *The difficulty and the house rules.* Difficulty sets the opponent’s economy; house rules are the real character: what you may do, what you must do, what counts as winning.
- *The mods.* Chapter 2’s list is one installation with two layers — the personas are all Layer 2 games, so make sure you have graduated before starting a persona run; each persona leans on the mods that matter to its playstyle and picks its game modes accordingly.
- *The save.* Name each game after its persona (grand-architect, grand-chancellor, ...) and keep one active game per persona — switching personas means starting a new chronicle, not a new install.

Good to know

All six personas run on the same modlist — the personas differ in civ, setup, and self-imposed rules, not in mods. They are *Layer 2 games*: learn the rules on a Layer 1 save (Chapter 1 installs it), then graduate. Keep one save per persona so you can always return to an old chronicle.

4.2 1 • The Architect of Wonders

The Architect of Wonders *Difficulty: King · Focus: culture, wonders, and a skyline that tells your story*

Background. You do not conquer the world; you **beautify** it. The Architect measures an empire in wonders per era, themed museums, and cities worth photographing. You pick wonder timings like a craftsman, plan districts like a city planner, and let the culture victory come as the natural by-product of building something worth remembering. Your empire should look as good on the map as it does on the victory screen.

Game creation choices

- **Civ & leader:** China led by Qin Shi Huang — the wonder-building, worker-driven kit that rewards exactly your obsession. (Egypt’s Cleopatra is the riverside alternative.)
- **Map:** Continents, Standard size, Standard speed, World age New (hills for the views).
- **Game modes:** Monopolies & Corporations on (monopolies multiply tourism); everything else default.
- **House rules:** at least two wonders completed every era; builders must be **earned** — no buying them with gold before the Medieval era; never chop a wonder’s production (real architects don’t demolish forests for columns).

- **Goal:** three wonders per era, one fully themed museum, and a culture victory — or simply the most beautiful empire at the score screen.
- **Era arc:** early — scout for wonder sites and grow to three cities; mid — one wonder per era plus themed museums; late — rock bands and the tourism finish.
- **Mods that shine:** Detailed Map Tacks (wonder adjacency planning), Extended Policy Cards, Terra Mirabilis (20 new natural wonders to build around), Resourceful 2 (more luxuries to keep your cities happy), Colorized Historic Moments, City Sprawl Graphics, Prettier Lakes.

4.3 2 • The Iron Chancellor

The Iron Chancellor *Difficulty: King–Emperor • Focus: domination through economy, not zerg*

Background. You are a statesman first and a general second: the Iron Chancellor builds an industrial heartland, then wages **surgical** wars — declared with cause, fought with corps, and closed with negotiated peace that extracts a price. You denounce, you demand, you calculate. With Real Strategy installed, the AI fights like a rival great power, which is exactly the opponent you want.

Game creation choices

- **Civ & leader:** Germany led by Frederick Barbarossa — extra district per city, the Hansa industrial district, and military city-state affinity.
- **Map:** Pangaea, Standard size, Standard speed (fighting on one continent; an Archipelago run is the veteran’s remix).
- **Game modes:** default modes off; Barbarian Clans on (more factions, more politics).
- **House rules:** no war before the Medieval era (chancellors prepare first); every war needs a **casus belli** — denounce first, then demand; never accept peace without a city, a luxury, or a tribute in gold; maintain a standing army of at least six units at all times.
- **Goal:** annex two rivals’ capitals, then win by domination — or by score if the world sues for peace first.
- **Era arc:** early — industrial base and two cities angled at your future rival; mid — casus belli, corps, the first capital; late — oil, air power, the last capitals.
- **Mods that shine:** Better Combat Preview (calculate every assault), Extended Diplomacy Ribbon (read the balance of power), Real Strategy (the AI pushes back), Real Tech Tree (plan the military research path), Production Queue (keep the war machine fed).

4.4 3 • The Cradle of Science

The Cradle of Science *Difficulty: Emperor • Focus: science victory, no shortcuts*

Background. You are a research institute with a flag. Every campus is a cathedral, every eureka a doctrine, and the space race is the only race you recognize. You out-tech your neighbors until the game is decided in your favor — not because the game was easy, but because you read it better. The Cradle plays clean: no gold-purchased progress, no exploited cheese — just the long compounding arc of a knowledge economy.

Game creation choices

- **Civ & leader:** Korea led by Seondeok — a campus-adjacency kit built for exactly this lane. (Scotland is the alternative for the happiness/tech angle.)
- **Map:** Continents, Standard size, Standard speed.
- **Game modes:** default modes off — a clean ruleset is the point.
- **House rules:** every city must contain a campus (settle accordingly); gold may **never** buy buildings or projects — everything must be produced or built; no reloading, ever; at least one research alliance maintained from the Medieval era on.
- **Goal:** science victory; the personal target is being first to the Information era tech tree’s crown.

- **Era arc:** early — campuses and eureka discipline; mid — universities and research alliances; late — the spaceport city and the Mars dash.
- **Mods that shine:** Detailed Map Tacks (campus adjacency), Better Report Screen (the empire-wide dashboard), Better Tech Tree + Real Tech Tree (chart the historical research path), Real Eureka (adapt to each game's boosts), Production Queue (space projects without idle cities).

4.5 4 • The Merchant Republic

The Merchant Republic *Difficulty: King · Focus: trade, gold, and winning the world congress*

Background. You were born with a ledger in hand. The Merchant Republic wins by being **indispensable**: every neighbor trades with you, every city-state Suzerain owes you a favour, and the world congress eventually votes for the republic that bankrolls the world. You measure your empire in trade routes at capacity, gold in the treasury, and diplomatic favour in the bank. When war comes — and it will — you buy the peace.

Game creation choices

- **Civ & leader:** Portugal led by João III — the trade-route economy, built for foreign ports and gold. (Netherlands is the riverside alternative.)
- **Map:** Archipelago, Standard size, Standard speed — a maritime world where routes and ports matter.
- **Game modes:** Monopolies & Corporations *on* (the mode this persona is built for); Secret Societies optional if you want a splash of fantasy.
- **House rules:** trade routes must run at capacity from the moment they unlock; gold must be reinvested within five turns (build, buy, or gift — no hoarding); every city-state you meet gets at least one envoy.
- **Goal:** diplomatic victory — or 100,000 gold in the treasury, whichever comes first.
- **Era arc:** early — ports and trade routes at capacity; mid — monopolies and corporations; late — diplomatic favour and the congress win.
- **Mods that shine:** Quick Deals (the market at a keystroke), Better Trade Screen (route yield sorting), Global Relations Panel (who owes whom), Resourceful 2 + Luxury Resource Variety (the monopoly raw material), Sukritact's Resources.

4.6 5 • The Faithful Pilgrim

The Faithful Pilgrim *Difficulty: King · Focus: religion, faith economy, and the slow conversion*

Background. You do not rush. The Pilgrim's faith spreads like a tide: founded early, defended patiently, and carried on trade routes and missionary trails to every corner of the map. Yours is the quiet victory — no armies, no rockets, just the quiet compounding of belief until the world converts around you. The modded game rewards this patience: a faith economy funds districts, buildings, and even the late-game culture push.

Game creation choices

- **Civ & leader:** Russia led by Peter the Great — the faith-and-culture-from-tundra kit with the Lavra district. (Byzantium is the aggressive alternative.)
- **Map:** Continents, Standard size, Standard speed.
- **Game modes:** default modes off.
- **House rules:** found a religion by turn 100 or restart the chronicle; every Holy Site must be **built**, never bought; convert at least one city in every other civilization — including rivals you never meet peacefully (trade routes and apostles do the job).
- **Goal:** religious victory, converted cleanly — and a faith stockpile to fund the endgame as a bonus.
- **Era arc:** early — Holy Sites and the prophet; mid — spread on trade routes and missionary trails; late — the final conversion.

- **Mods that shine:** More Lenses (holy-site adjacency), Extended Policy Cards (faith policies), Real Great People (the overview that plans your prophet and apostles), Better Report Screen.

4.7 6 • The Chronicler of Eras

The Chronicler of Eras *Difficulty: Prince · Focus: the living world — no victory hunting*

Background. You play the long game that isn't a game: the Chronicler builds a **world** and lets history happen to it. Wars, golden ages, floods, and revolutions all belong in the record. You name your cities in the tongue of the era (Rosetta does the renaming), pause at era transitions to admire the map, and let Dramatic Ages toss your empire up and down. Victory is optional — the chronicle is the point. Screenshots welcome.

Game creation choices

- **Civ & leader:** your pick — Rome led by Trajan is the classic empire-building arc; Japan or Egypt change the flavor of the chronicle.
- **Map:** YnAMP *True Start Earth* (or Continents), up to Enormous size, *Epic* speed — the world gets time to breathe.
- **Game modes:** Barbarian Clans and Dramatic Ages *on* (history should bite); Sukritact's Oceans on if you use a standard map script instead of YnAMP.
- **House rules:** never chase a victory type — pursue whatever the era demands (era score decides); never restart a save, never reload a disaster; screenshot every era transition; write the story in your head as you go.
- **Goal:** a world history you would retell — and the highest era score you can honestly earn.
- **Era arc:** no fixed arc — follow the era score: wars when the world is angry, wonders when it is peaceful, and golden ages whenever history demands them.
- **Mods that shine:** the whole World & Content stack — YnAMP, Rosetta, Terra Mirabilis, Wetlands, Sukritact's Resources (+ Oceans), Resourceful 2, Environment Skin, Denser Vegetation, City Sprawl Graphics, Colorized Historic Moments, Hillier Hills, Prettier Lakes — plus Real Tech Tree and, if you want the eras to breathe, Extended Eras.

4.8 How to start a persona run

1. Create a game in **Advanced Setup** with the persona's settings from above.
2. Name the save grand-<persona> so the chronicles stay separate.
3. Write your house rules on paper — three lines of rules beat a forgotten promise in turn 200.
4. Enable the persona's game modes and play the first era following its priorities.

Persona	Difficulty	Signature mods
The Architect of Wonders	King	Detailed Map Tacks, Terra Mirabilis, Resourceful 2, Colorized Historic Moments, City Sprawl Graphics
The Iron Chancellor	King–Emperor	Better Combat Preview, Extended Diplomacy Ribbon, Real Strategy, Real Tech Tree, Production Queue
The Cradle of Science	Emperor	Detailed Map Tacks, Better Tech Tree, Real Tech Tree, Real Eureka's, Production Queue
The Merchant Republic	King	Quick Deals, Better Trade Screen, Global Relations Panel, Resourceful 2, Luxury Resource Variety
The Faithful Pilgrim	King	More Lenses, Extended Policy Cards, Real Great People, Better Report Screen
The Chronicler of Eras	Prince	YnAMP, Rosetta, Terra Mirabilis, Wetlands, Environment Skin, Denser Vegetation, Real Tech Tree
